THE OYSTER.

A Popular Summary of a Scientific Study.

BY

WILLIAM K. BROOKS, Ph.D.,

Professor of Animal Morphology in the Johns Hopkins University and Director of the Chesapeake Zoölogical Laboratory.

A study of the Natural History of the Oyster, and a discussion of Oyster culture. 240 pages, 12°, and 14 lithographic plates. Cloth. Price, $1.00 net.

Orders should be sent to

THE JOHNS HOPKINS PRESS, Baltimore, Md.

THE TREASURER

OF A

Massachusetts Corporation

Will be at liberty September 15, and wishes a similar position in Boston. For interview, address L., Box 235, Boston.

Letters of Credit.

We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and the West Indies; also make Collections and issue Commercial and Travellers' Credits, available in all parts of the world.

Brown Brothers & Co., Bankers,

NO. 59 WALL STREET, NEW YORK.

Carbolate of Tar Inhalant.

Catarrh, Deafness, Bronchitis, Consumption, Asthma, cured at home. New pamphlet and full particulars free. Address, naming this paper,

DR. M. W. CASE,

809 North Broad Street, Philadelphia, Pa.

Houghton, Mifflin & Co.'s Saturday Books.

The American Revolution.

By JOHN FISKE. With Plans of Battles, and a new Steel Portrait of Washington from a miniature never before reproduced. 2 vols., crown 8vo, gilt top, $4.00.

Readers of American history are to be congratulated on the opportunity of tracing the causes and course of the Revolution in Mr. Fiske's wonderfully luminous narrative.

Fourteen to One.

A book of remarkably good Short Stories, including 'Jack the Fisherman' and 'The Madonna of the Tubs.' By ELIZABETH STUART PHELPS. 16mo, $1.25.

Colonel Carter of Cartersville.

By F. HOPKINSON SMITH. With Illustrations. 16mo, $1.25.

Colonel Carter is a fine specimen of one type of the Virginia gentleman of the passing generation. He is exquisitely courteous, recklessly hospitable, with a vivid financial imagination. The delightful story is admirably told and illustrated.

Balaam and His Master, and Other Stories

By JOEL CHANDLER HARRIS, author of 'Nights with Uncle Remus,' 'Mingo, and Other Sketches.' 16mo, $1.25.

Another book of those exceedingly interesting Southern stories which Mr. Harris tells so well.

Otto the Knight, and Other Stories.

By OCTAVE THANET, author of 'Knitters in the Sun,' etc. 16mo, $1.25.

"The gifts of Octave Thanet are among the greatest which the story-teller can possess."—R. H. STODDARD.

A Girl Graduate.

A Novel. By CELIA PARKER WOOLLEY. Riverside Paper Series. 50 cents.

"Thoroughly excellent from beginning to end."—*Boston Transcript.*

*** For sale by all Booksellers. Sent, post paid, on receipt of price by the Publishers,*

The Nation.

NEW YORK, THURSDAY, MAY 14, 1891.

The Week.

THE presentment made by the New Orleans Grand Jury on the events of the 14th of March in that city reads more like the report of a Committee of Public Safety than a legal narrative. The Grand Jurors devote themselves mainly to an exposure of the condition of the jury system in their city, and indict six men for "jury fixing"; but, although they find that the acquittal of the Italian assassins was a corrupt verdict, they indict none of the jurors who were "fixed." The attack on the jail on the 14th of March they dispose of very briefly. What they say about it is that, after the trial,

"Good citizens were profoundly impressed by the repeated and signal failures of justice. The arts of the perjurer and briber seemed to dominate in the courts, paralyzing and rendering powerless the ends of justice. Certainly, this was a desperate situation."

A meeting was thereupon called to discuss this desperate situation on the day in question. It "embraced several thousands of the first, best, and most law-abiding citizens of the city, who assembled, as is the right of American citizens, to discuss in public meeting questions of grave import." At that meeting "the determination was shown that the people would not submit to the surrender of their rights into the hands of midnight assassins or their powerful allies." The number of citizens participating in the demonstration is estimated at 6,000 to 8,000, and the Grand Jury pronounces it "a spontaneous uprising of the people," and says: "The magnitude of the affair makes it a difficult task to fix the guilt on any number of the participants; in fact, the act seemed to involve the entire people of the parish and city of New Orleans, so profuse is their sympathy, and so extended their connection with the affair." This, as we have said, is not a legal document. It is the apology of a political committee for an act of revolutionary violence committed by the entire population of a large city, and expressed in the inflated rhetoric in which such manifestoes are usually couched. We fear, therefore, it will not give Mr. Blaine much help in any further controversy he may have with the Marquis di Rudini.

Senator Quay's personal organ in Philadelphia, the *Inquirer*, publishes a leading article informing the President that he "ought to call off his son" from making further statements in his illustrated newspaper about Mr. Blaine, and Mr. Blaine's attitude towards the President, and the President's right to the authorship of Mr. Blaine's alleged ideas. "The combative attitude that young Mr. Harrison has assumed," says Mr. Quay's mouthpiece, "seems to indicate a fear that Blaine may prove a stumbling-block. The position taken by the young man is unquestionably a mistaken one. He should have confidence in Blaine, not distrust. He is taking the right course to force the Secretary to the front." This deliverance from Quay adds greatly to the interest of the Republican situation. The President is travelling over the country claiming in his speeches that he is the originator of all the ideas for which Mr. Blaine has been getting credit. The President's son is saying in his newspaper that not only is what his father says accurate and truthful, but that Mr. Blaine is willing to admit the same, and is so eager for his father to be renominated that he will not consent to have his name mentioned as a candidate. Now comes Quay, who elected Mr. Harrison President, and who is kept at the head of the National Republican Committee by the President's influence, and advises the President to "call off his son." Prince Russell ought to turn about now and advise his father to "call off" Quay.

There is nothing surprising in the report which comes from Ohio that the Republicans of that State are beginning to have doubts about the wisdom of running Mr. McKinley as their candidate for Governor. They begin to perceive that his candidacy would involve a large number of political complications, any one of which might prove fatal. In the first place, if he runs, it must be as the author of the McKinley tariff, and hence that tariff will be the chief issue of the campaign, making it necessary to defend high prices and denounce cheapness as un-American and nasty. In the second place, if Mr. McKinley were to be elected, he would at once become a formidable candidate for the Republican nomination for the Presidency next year, to the exclusion of all other Ohio aspirants and to the damage of the President and of Mr. Blaine, or whatever person shall be chosen to represent his reciprocity ideas. With McKinley as its Presidential candidate, the Republican party must go before the country on the McKinley tariff—that is to say, without any reciprocity to speak of either in its platform or its campaign.

The more the Ohio Republicans look at these conditions, the more they doubt. Are McKinley prices so popular in the State that a Republican victory with them as a battle-cry can be anticipated? That is the first question they ask, and its answer is not so favorable as they wish it was. Would other Presidential candidates in Ohio and elsewhere assist in lifting McKinley into formidable prominence as a Presidential candidate, or would they allow "apathy," or a "knife," or some other occult political influence to remove him from the national field through the medium of a State defeat? Would either the friends of the President or the champions of Blaine and Reciprocity, or Blaine and Business, be likely to exert themselves energetically for McKinley's success? These are questions which disseminate silence and gloom in all Republican circles in which they are raised. The chilling reception which the muzzled Republican press of the country gave to McKinley's "great speech" at the recent high-tariff banquet in this city, is cited as affording grounds for grave suspicion that he may be much too heavily loaded with uncertain issues to be a safe candidate to run for Governor this year.

The Republican leaders in Pennsylvania have succeeded in "fixing" the pending Ballot Bill so thoroughly that they are now willing it should pass the Senate. Its author says he disclaims it utterly, and would much rather see it defeated than passed. As it stands it furnishes a model of a Machine politician's idea of ballot reform. It makes 10,000 names necessary for an independent nomination for any State office. It requires all independent nomination papers to be filed three months in advance of election. These are, of course, nothing less than prohibitive provisions, and are meant to be such. They are correct samples of nearly all the changes which the Senate Committee has made, and their object is without doubt the destruction of the bill. There has never been any hope that Boss Quay and Mr. Cooper, ex-Chairman of the Republican State Committee, would allow the Republican majority in the Legislature to carry out the party's pledge to give the State genuine ballot reform. Both these leaders, who control the Legislature absolutely, have been outspoken against the reform, and the only doubt as to the Legislature's conduct has been as to the way in which the defeat would be accomplished.

A fresh proof of the incompetency of the modern legislator comes from Tennessee. During the recent session an attempt was made to amend the election laws so that they should apply to counties having a population of 50,000, but in the process the registration law was made to read, "having a voting population of 50,000." No county in the State has a "voting" population of 50,000, and, as a consequence, it is held that the registration law fails, and carries down with it the Dortch Secret-Ballot Law, because the latter law is based upon the existence of a registration law, and forbids a man to vote without showing his registration certificate. The blunder is ascribed to carelessness in engrossing and inattention on the part of members when the amendment came up for action. It is taken for granted that the Governor will have to call an extra session, as the error invalidates all the election laws of the State. What makes the matter worse is the fact that the preceding Legislature muddled the same subject, and had to be called together in special session to revise its

work. It really looks as though law-making would soon be a lost art.

The temporizing policy of Bulkeley in the Connecticut lawsuit over the Governorship still goes on under a mask of legal subtlety and craft. What was evidently his original intention, of delaying the case by pleading directly no jurisdiction of the courts, had to be modified, owing to the Democratic outcry and the objections of the Merwin men. So instead last week he filed an answer which, while not raising the jurisdiction question regularly, seems to have raised it practically, and, besides, brought in certain questions of disputed fact which are likely to drag the suit through a lower court before it reaches the supreme tribunal of the State. As has been the case heretofore, Bulkeley was able also to force his policy on Merwin, whose meek conduct under the coercion of the hold-over Governor is a singular exhibition of political weakness. Indeed, the whole attitude of the Republicans, as a party, in the State is most discreditable. A few weeks ago, while the dispute was in the Legislature, they were clamoring to have it go to the Supreme Court for "advice." Now, after the Republican House has gone home and the Democrats have rushed the case to court in the form of a regular lawsuit, the Republicans, including Bulkeley, pettifog and act exactly as though they were afraid of the decision of a tribunal in which four out of five Judges confess the Republican faith.

The trustees of the Ohio State University are facing the old and difficult problem how to make their graduates, or at least a goodly proportion of them, turn farmers. One of the principal objects of the institution was the education of the sons of farmers with a view to filling the agricultural regions with an intelligent, educated race of men, who should be able to develop the resources of the land to the utmost; but nearly all of the students insist upon entering the professions. The trustees, at a meeting last week, decided to appoint a committee who should accompany the President on a visit to similar institutions in other States, and learn what they are doing to encourage the students to avoid the professions and devote themselves to agriculture. But there is little to hope from such a tour, for the same complaint is made from every agricultural college in the land.

One suggestion of interest, however, comes from the Ohio University. The Columbus correspondent of the Cincinnati *Times-Star* says that there has been a change in farming methods which opens better opportunities for educated young men. According to this authority, the financial straits of the small farmers have been throwing large tracts of land into the hands of capitalists who believe that the methods employed in large business enterprises can be successfully applied to agriculture. But this will involve the superintendence of these large holdings by men who are more than mere hewers of wood and drawers of water, and here is believed to be an attractive opening for educated young men. One of the trustees is quoted as saying that he has one friend, a wealthy Cincinnatian, who owns 1,000 acres in Highland County, and who would gladly pay a man of the necessary qualifications to manage the property $2,000 a year besides his home and food; and another friend who owns seven farms, and who wants a man to take charge of them, and who would cheerfully pay $2,000 or $2,500 a year to some one who could take all the care of them off his shoulders and hand him the profits at the end of each year. This trustee says that if any young man will come to the University and acquire a thorough education in the advanced studies, and at the same time make a special study of agriculture, "I'll guarantee that he will not have to wait long for a well-paying position." If this is a correct view of the situation, it may be possible to draw young men back from the University to the farms. They certainly will not go unless there is a good prospect of "a well-paying position."

Those mysterious "American Tin Plate Works" are on the move again. The Philadelphia *Press* of Saturday has the news of the sudden appearance of them in two places. It publishes the telegram from Anderson, Ind., saying that a party of "Chicago capitalists closed a contract Friday night with an Elwood, Ind., land syndicate for the erection of a tin-plate factory at that place to employ 500 people. The plant is to be in operation by January 1, 1892." The *Press* precedes this joyful intelligence with a jubilant account of a similar development in its own city on Friday. "A great company," it says, "most of the incorporators of which are Philadelphians, has been organized and will soon be incorporated under the laws of Pennsylvania for the purpose of the manufacture of tin and terne plates, black plate, taggers, and sheet steel, with a capital of $1,000,000, with the power to increase this capital. The Chairman of the Board of Directors of the new company is F. R. Phillips, who said last night that the mills will be located in the neighborhood of this city on one of the main lines. Four mills will be erected at first with a product of 2,000 boxes of finished plates per week, and it is proposed as soon as possible to increase the plant to twenty mills with a product of 10,000 boxes per week, or a total yearly product of 500,000 boxes." There is some indefiniteness about the exact location, but this is a peculiarity of the "works." They are almost invariably to be "near" some place or other. There is to be no chance for foreigners in this enterprise. "It is declared," says the *Press*, "that the company will be thoroughly American, and that no Welshman, unless he has become a naturalized American, will ever be allowed to be a stockholder. Neither will any Welsh or other alien employees be engaged, unless they are citizens, or have declared their intention of becoming citizens. It is also proposed to give skilled workmen a pro-rata percentage of the profits."

Purchasers of tin plate, meanwhile, will do well not to be deceived by advertised offers of "American tin plate," even when accompanied by a specimen of the tin, or a picture of "the works," both of which devices are being resorted to. There is no reason to believe that as yet "the works" anywhere consist of anything but a room, with a pot of solder, in which English steel or iron plates are dipped by an "old man and a boy." A picture of a factory is of no more value as proof that tin-making goes on inside than the hole the 'coon came out of was proof that the boy had killed the animal. The truth seems to be that the effect of the tariff on the morality of those whom it protects, is very like that of the horse on the character of the men who deal in that noble beast. No early training or even religious culture seems sufficient fortification against its insidious influence. It is, like the horse, full of defects and shortcomings, which have to be covered up somehow or anyhow, and the current kind of covering is bald lying. Hence the forged quotations, and the fables about the Cobden Club, and the semi-lunatical praise of dearness, and the curious concoctions about the tin-plate manufacture.

The agency of the railroad companies in promoting temperance is not generally appreciated. They employ 689,912 persons, not counting those who mine the coal and iron, make the rails or locomotives, or build the cars and carriages used by the road. The freight and passenger traffic of the country is practically controlled by 600 of these corporations, and of these 600 no fewer than 375 prohibit the use of intoxicating liquors by their employees, among the number being most of the largest companies. The Brotherhood of Locomotive Engineers uses its influence in the same direction. "Whenever a member of the order is known to be dissipated," says Mr. Arthur, long the head of the organization, "we not only expel or suspend him, but notify his employers," and during the last year 375 members were expelled for this cause. This is only one illustration of the way in which practical business considerations are operating to promote the spread of temperance. It is purely a matter of business with the railroad companies. They simply cannot afford to employ a man who is liable any day to get drunk and precipitate some terrible disaster. In like manner other employers find that it pays them much better to hire a man who is not in the habit of drinking than one who may be intoxicated when his services are most needed, and between two applicants they give the preference to the one upon whom they can depend. The average workingman thus comes to see that it is "money in his pocket," in more senses than one, if he keeps out of the saloon; and the moral is not lost upon him.

Presbyterians were looking forward to a peaceful and harmonious meeting of the General Assembly, at the end of this month. The report was given out that the committee on the revision of the Westminster Confession had unexpectedly been able to agree. Thus the burning question of last year's Assembly was to be quickly settled, and unpleasant doctrinal debates put to one side. But just about that time came the startling inaugural address of Prof. Briggs. It instantly buried the revision matter out of sight. The learned committee that had so carefully prepared their compromise report on the two or three points of sublimated theology in debate, saw their work forgotten—forgot it themselves, in fact—in the presence of the bold challenge of the Union Seminary professor. In place of theological quiddities, he brought sharply forward a question of fact: not whether this or the other logical inference could be made from an infallible record, but whether the record itself was infallible; not whether this or that theory of inspiration was the correct one, but whether the Church was to go on any longer with eyes shut to the revolution wrought by modern scholarship in every thinking man's conception of the Bible. No wonder that more than forty presbyteries should have already called for the suppression of the fearless questioner, that the denominational press should be filled with discussions of his case, and that action upon it is to be the main event at the Detroit gathering.

Prof. Briggs is no rash enthusiast courting martyrdom. There is method and a fixed purpose in his audacity. He himself was an opponent of revision of the official creed. This was partly due to his extremely conservative theology, if one can distinguish, as he seems to, between that and his Biblical scholarship, and partly to his belief that no revision practicable would be thorough enough to meet the case. His idea has been to let the creed alone, but to give an official sanction to the loose way in which it has been notoriously taken by many subscribers to it. In his "American Presbyterianism" he pointed out that this is the way in which the Church can constitutionally recognize progress in doctrine. The creed is subscribed to for "system of doctrine." Now, says the Professor, let the Church from time to time declare as to certain debated points whether they are consistent with the "system," and there you have the evolution of doctrine perfectly provided for without any need of formal revision. It seems clear to us that the decision must be against him. He will be stoned, and the next generation in his church will build his sepulchre. The time for the advance which he advocates has not yet come. He has a considerable avowed following, it is true, and a greater number of uncommitted sympathizers. Two professors in Lane Seminary and one in McCormick have ranged themselves by his side. Many of the younger ministry will vote to sustain or at least to tolerate him. But the large majority of his denomination is undoubtedly against him—in parts, bitterly against him. And we cannot doubt that the American Presbyterian Church will soon be able to claim the distinction already achieved by the Free Church of Scotland—that of having silenced its most learned professor.

The chief interest of the late "bye-elections" in England lies in the fact that they are considered to be, and are, an answer to the bid for votes made in Mr. Goschen's budget. As a general rule, a popular budget is one which not only shows a surplus, as his has done, but also makes some remission of taxes. In truth, the production of a surplus is apt to involve an English Minister of Finance in a sea of troubles, owing to the pressure of various interests for a lightening of their burdens. Mr. Goschen made a great blunder in the last session of Parliament by an attempt to treat a publican's license as a "vested interest," entitling him to compensation in case it were revoked for any other cause than misconduct, and he actually attempted to provide, by an increase of taxation on beer and spirits, a fund for such compensation. This was treated, and not unreasonably, as a bid for the liquor-dealers' vote at the general election supposed to be near at hand, but, after raising a storm of obloquy, the project was killed by a shrewd parliamentary objection interposed by "Tim" Healy. The gloom which this spread in the Conservative ranks was dispelled by Parnell's downfall and the resulting split among the Irish. This split, and the resulting cudgel play in Ireland, were considered the ruin of the Home-Rule cause and the complete and final discredit of the Gladstonians. The Tories, in accordance with Lord Salisbury's advice, all "put their money on Parnell," and felt very confident that the Irish constituencies would stick to him in a way that would definitively alienate the bulk of the Liberal party in England. But things did not fall out in this way. The Irish did not stick to Parnell, and when the Hartlepool election came round, to the astonishment of everybody a great Liberal victory proved that the Parnellite dissensions had made no serious impression on the Liberal vote.

Things were in this position when Mr. Goschen, on the 24th of April, introduced his budget. Every one expected that it would contain some feature intended to restore the Tory fortunes, and that it would probably be something outbidding the Radicals for the working-class vote—an old Tory device, already successfully practised in times of distress both by the late Lord Derby and by Lord Beaconsfield. But nobody, or very few, expected that it would be be a proposal to use the surplus in establishing absolutely free schools, because there is probably no one article in the Radical programme against which all the leading men of the Tory party were more thoroughly committed. They have nearly all denounced it on the stump, chief among them Mr. Goschen himself. But apparently both the Ministry and the Liberal Unionists have given way to the seeming necessity of the hour, and are preparing to go to the country with a proposal which is perhaps the most remarkable piece of tergiversation in their history. Coming from a party which has been greatly shocked by the immorality of Mr. Gladstone's change of mind on the Irish question, there is wonderful audacity in it. Mr. Goschen revealed the scheme on the 24th of April. The judgments of the constituencies on it began to come in ten days later. On the 6th of May the Liberals won the seat of Stowmarket, in Suffolk. On the 8th of May they cut down the Conservative majority of 991 at the last election in South Dorset to 40 on a much larger vote. Finally, on the 9th of May they won another seat in South Leicester, a Tory stronghold, by a majority of 489, also on a much larger vote, where they were defeated in 1886 by majority of 1,138—a succession of most disheartening disasters for the Conservatives.

The International Congress of Miners, held at Paris during the first week in April, was a body made up of ninety-nine delegates, representing 909,167 miners. Great Britain had forty-one delegates for 448,636 constituents, Germany eighteen for 141,531, Austria but one for 100,000, Belgium sixteen for 92,000, and France twenty-three for 127,000. The chief end of the gathering was the furthering of the project to secure an international agreement for an eight-hours' day. On all hands it was believed that the surest means was a general strike, or, at least, the threat of one. The main difference was over the question of the immediateness of such a strike. The Belgian delegates were for precipitate action, but the Englishmen were for cautious proceedings, and their views prevailed. Accordingly the resolutions ultimately adopted set forth the determination to order a strike of miners throughout Europe, if necessary, but first called upon Governments and Legislatures to set about securing international legislation of a special sort for miners, including the eight hours' day. Such special agreements had been given international effect, the resolutions argued, in the case of mails and the telegraph, as also in that of railroads and other forms of international communication. There was no reason why the same thing should not be sought in the interest of miners. Another resolution was adopted proclaiming the solidarity of miners throughout the world, and promising aid to the Belgians in their coming strike, by refusing to mine coal to be sent to Belgium, and in all other ways possible. The Committee on preparing a plan for an International Federation of Miners was continued, with instructions to report at the next Congress. In connection with this, we may mention a workingmen's convention held in Brussels April 5, which threatened a general strike throughout Belgium unless the Chambers should grant universal suffrage.

AN INSTRUCTIVE PARALLEL.

THE New Orleans Grand Jury's account of the causes which led to the lynching of March, 1891, should be read in connection with the history of the Cincinnati riots of March, 1884. Nothing bears stronger evidence of the ease with which Americans forget even the most impressive events, than the fact that the New Orleans affair is almost universally spoken of as the first uprising of the kind in our national history. In many ways it was the duplicate of the Cincinnati disturbance. Its first cause was the same, the complete breakdown of the machinery of criminal justice, owing to the tampering of politicians and criminal lawyers with the jury system and the criminal laws. It is worth while to recall briefly the history of the Cincinnati riots in order that the closeness of the parallel may be seen.

On March 28, William Berner, who had made no less than seven confessions of his guilt in committing a most brutal murder, was convicted, after a long trial, of murder in the third degree, and sentenced to twenty years' imprisonment. The verdict was at once denounced as an outrageous miscarriage of justice. Judge Carter of the Court of Common Pleas of Cincinnati said at the time, that Berner escaped hanging by a "verdict acquired by the cunning and adroitness of lawyers known for their legal talent," and that they had succeeded because the "father of the murderer had $6,000 or $7,000 to spend." Scarcely had the result been published when a mass meeting of citizens to take action on the verdict was called to meet in Music Hall. Fully 10,000 people, including the most eminent and respectable citizens, assembled, and the meeting was called to order by one of the foremost physicians of the city. Speeches were made in which it was shown that during the eighteen years between 1866 and 1884 there had been only two convictions for murder in the county; that one of these had been of a negro, and that the sentence of the other murderer had been commuted to imprisonment for life; that there were at that moment no less than twenty-three murderers in the city jail who had not been brought to justice, and that this condition of affairs was due to a corrupted jury system and to the presence in the city of a large force of astute and unscrupulous criminal lawyers, who were working in connivance with political leaders to protect criminals from the penalties of their crimes. Resolutions were adopted denouncing the Berner verdict and the loose methods of criminal justice which had made it and other similar verdicts the rule, and appointing a committee of fifty to report at a second meeting a plan for correcting the evils complained of.

The assemblage refused to wait for the second meeting. During the proceedings there had been repeated cries of "Hang the jury!" "Burn the jail!" "Hang Tom Campbell!" The latter was the leading criminal lawyer, and had been Berner's counsel. He was a political power in the community, for reasons similar to those which make men of the same type "powers" in any great city. As soon as the meeting adjourned, the crowd, composed mainly of laboring men, but embracing men of good character and orderly habits of life, organized itself into a mob and started for the city jail. On the way they broke into a blacksmith's shop and obtained instruments for breaking down the doors. They assaulted the jail, but found it well guarded, first by police and afterwards by the militia, which was called out for its protection. The latter fired upon the crowd, killing and wounding many innocent people. On the next night a second and much more formidable riot broke out, in which all the most disorderly elements of the population joined. Their point of attack this time was the County Court-house. They rolled barrels of coal oil against the sides of it, and threw dynamite bombs through the windows, setting fire to it, and burning it to the ground, destroying many valuable records and documents. They were repeatedly fired upon by the militia, and many more people were killed and wounded. The riot broke out again on the third night, and yet more people had to be killed before the city became quiet. In all about 50 people were killed and 120 wounded.

In their report upon the riots the Cincinnati Grand Jury said in May following that they had been caused by a popular belief that the administration of justice in the courts had been blocked by the bribing and "fixing" of jurors to meet the designs of politicians and criminal lawyers, and that this nefarious work had been assisted by the conduct of the so-called good citizens in avoiding jury duty. Fifty-four persons were indicted, including "Tom" Campbell.

It will be seen that the causes in New Orleans and Cincinnati were practically identical. They arose in both cases from the pernicious activity of the political and criminal forces in the community on the one hand, and the indifference and carelessness of the respectable elements of the community on the other. In both cities the point was reached at which evils whose existence had been known and tolerated for years became intolerable, and the only way in which the crisis could be met was by a resort to the methods of barbarism. Is it necessary to point out that many other American cities are travelling the same dangerous path today, with the same indifference? In how many of them is the machinery of criminal justice kept free from the corrupting touch of politics? Look at our system in New York, with our "Mikes" on the police justice bench, and our "Barneys" in charge of the jury lists, and with Tammany's gang of semi-criminals in charge of every department of the city government. Are we prepared to sit still until the time comes when we shall have nothing left to turn to, to set us right, except a mob? And if we were to resort to a mob, would our best citizens be able to control it? What is the condition of Boston, so far as its police and criminal classes are concerned? Gov. Russell tried to break the obvious and notorious connection tween the two, but the whole power of the Republican party in the State was used to prevent him, and succeeded. Is Boston prepared to go on tolerating its evils till they become intolerable and the mob point is reached? Are other cities prepared to do the same? If so, then we ought to turn our attention to the invention of some system of regularizing mob law. Why not fix a public holiday once a year, to be called Mob Day, for the assemblage of a reformatory mob and the selection of politicians and criminal lawyers to be shot or hanged, and of houses to be wrecked and gunshops to be plundered?

MR. BLAINE'S TU-QUOQUES.

MR. BLAINE'S last despatch to Lord Salisbury on the Bering Sea question has been published, but contains nothing new except a *tu-quoque* in the shape of a recent statute of Great Britain (1889) regulating the mode of fishing within the great bay on the northeast coast of Scotland, between Duncansby Head in Caithness and Rattray Point in Aberdeenshire, "comprising an area of 2,700 square miles of ocean on the coast of Scotland." He accepts Lord Salisbury's proposed points of arbitration, with a few unimportant modifications, so that on the general subject there is nothing more to be said.

Nothing in this controversy has brought out so strikingly his ignorance or fatuity—one cannot tell which, owing to the presence of the "North American Commercial Company" in the background—as his *tu-quoques*. They have been from the beginning veritable curiosities. He assumes that any British statute prohibiting anything on the high seas is meant to be applied to foreigners if foreigners are not expressly exempted. The presumption in all civilized countries is exactly the other way. All municipal statutes are presumed, as a matter of course, to apply only to the subjects or citizens of the Power which makes them. Consequently, an act of the British Parliament cannot control foreigners on the high seas, whether it mentions them or not.

This point did not need judicial settlement, but it received it just seventy-five years ago in the *St. Louis* case, where a Frenchman whose ship had been seized as a slave-trader by a British cruiser, got damages against the commanding officer in the British Court of Admiralty, Lord Stowell laying down the law—which is law still—that no act of Parliament can overrule the law of nations. Consequently, when a British act of Parliament says that "no person" shall do so and so, it means, as a matter of course, no subject of her Majesty Queen Victoria, just as the American statutes regulating the Alaska fisheries, when they say "all persons," or "no persons," mean citizens of the United States. This rule applied to the St. Helena *tu-quoque*, and also to the Australian pearl-fishery *tu-quoque*, as well as to the Scotch *tu-quoque*. They are all ridiculous. If any American ship had been seized for "hovering" eight leagues from the shore of St. Helena, the captain of the cruiser would have been cast in damages in the British Court of Admiralty, and the ship returned to the owners. If any foreign vessel were now seized for violation of

the Australian statutes regulating ocean pearl fisheries, or for violating the British statutes regulating Scotch high-sea fisheries, the same result would follow.

Mr. Blaine does not cite the Australian statutes at first hand, but simply quotes a vague reference to them from a book of Sir George Baden-Powell's. The Australian Act of the Federal Council to which Mr. Blaine has referred, of August 18, 1890, regulating open-sea fisheries on the coast of West Australia, is careful to state that "this act applies only to British ships and boats attached to British ships." The "similar act" to which he refers, as having been passed by Queensland in 1888, but which he does not specifically describe, and which cannot be found in the Queensland statutes, is, if it exists, probably the same as the Queensland fishing statute of 1886, amending a statute of 1881, which simply declares that "*pearl and bêche-de-mer fishing shall be unlawful within the colony of Queensland, or within one league to seaward from any part thereof, without a license.*"

One does not well know what to say of a Secretary of State who sticks to these childishnesses through thick and thin. The journalistic geese who follow his lead and applaud him, are more easily described.

If any civilized Power were to put in its statutes an express claim of jurisdiction over foreigners on the high seas, we do not believe it would call forth anything but smiles from other nations. No other government would take the trouble to protest against it, as long as no attempt was made to enforce it. Down to the reign of George IV., the King of England described himself officially, even on his coins, as "King of Great Britain, France, and Ireland," but Frenchmen did not concern themselves about his claim as long as he did not try to make it good. In like manner, the King of Sardinia, down to the establishment of the Italian kingdom, called himself "King of Sardinia, Cyprus, and Jerusalem," but the rest of the world let the thing pass as a good mediæval joke. They would treat British or American municipal legislation expressly asserting the right to control foreigners on the high seas, or in foreign territory, with similar indifference.

This, too, explains the indifference with which the Czar's 100-mile ukase about Bering Sea was treated. As long as no vessels were seized under it—and none were seized—the maritime Powers ignored it utterly. It probably pleased the Czar and did them no harm. All departures from the rule of the freedom of the seas, even as regards the slave-trade, have to be settled by joint agreement. Nobody but a pirate is on the high seas subject to every country's jurisdiction, because he is held to be an enemy of the human race. These are things which ought, apparently, to be taught in primary schools, for some of us seem to find them so hard to comprehend that instruction in them cannot begin too early. Mr. Blaine has given the *Tribune* a map illustrating the Scotch *tu-quoque*, a performance which is worthy of *Puck*, for it is in that journal that the map ought to have appeared. The production of an engraved diagram to illustrate one's own ignorance is something new in comedy.

TAXATION IN MASSACHUSETTS.

In the determined efforts recently made in New York and New Jersey to introduce more rigorous systems of taxation, great stress was laid by the supporters of the proposed measures upon the example of Massachusetts. It is interesting, therefore, to learn that a vigorous attempt to reform the system prevailing in that State is now going on, the principles of the desired reform being stated in the report of a commission on taxation appointed by the Mayor of Boston. While the Commissioners could hardly be expected to adduce new arguments upon so well-worn a theme, they have certainly succeeded in stating their case with so much clearness and force as to deserve universal attention.

The burden of taxation in Boston is not a light one, amounting for municipal purposes to nearly $38 *per caput*, exclusive of revenue derived from licenses and miscellaneous resources. In spite of the severity of the law, and of its execution, about three-fourths of the revenue raised by taxation comes from real estate, and if all personal property were exempt, the rate of taxation on land would be little more than $17 per thousand of the assessed valuation. The Commissioners are decidedly of the opinion that it would be expedient to confine taxation to real estate, considering that the encouragement given to manufactures and commerce by this policy would very soon render the burden upon land no heavier than it is at present. They declare that many industries have been driven out of Boston by the present laws, and that many which would have come there have thought it safer to go elsewhere. Boston, they say, "is avoided like a house guarded by a savage dog. It is true that one may not be bitten; but it is pleasanter to go where the dog is not so fierce."

The Commissioners, however, do not propose to abolish all taxation upon personal property, but devote their attention to an extremely plain statement of the case against double taxation. They point out that the city of Boston, whose credit is beyond all suspicion, and we may add is sustained by decisions that make all the property of its inhabitants security for its corporate indebtedness, could borrow at a rate of interest one-half of one per cent. lower than it now pays, if its bonds were not subject to taxation when held by its own citizens. This saving would amount to $250,000 a year, while the whole amount of town and city bonds included in the sworn returns to the assessors for 1890 is $384,000, upon which the tax is less than $5,000. In short, the municipalities of Massachusetts compel themselves to borrow of non-residents by threatening their own citizens with a deduction from the interest stipulated in their bonds. Residents of Massachusetts, therefore, invest in the bonds of foreign municipalities by preference, as it is easier for them to conceal the possession of such securities.

It may be laid down as substantially true that the rate of interest paid by safe investments is determined without reference to the taxation of income arising from this source. Such income is very generally taxable, but only exceptionally taxed. Were it otherwise the net return upon such investments would be to residents in many of our cities less than 2 per cent. In the language of the Commissioners:

"The holder of a 4 per cent. bond of the Chicago, Burlington and Quincy Railroad, *if he is taxed*, pays the tax out of his own pocket, because his being taxed is an accident. It is not a payment under the universal law of trade, but a piece of ill luck, like having his pockets picked of the same sum. The risk of such accidents is greater in Massachusetts than anywhere else, because our system is more ingenious and greater vigilance is exercised. The risk in New York and Chicago is much less. In Philadelphia there is no risk at all. . . . If all civilized nations were able to and did tax the lender on every railroad bond in the world $15 a thousand, there is no doubt that the Chicago, Burlington and Quincy Railroad would have to pay about one and one-half per cent. above the present average interest rates. While London and Berlin, New York and Philadelphia stand ready to lend the Chicago, Burlington and Quincy Railroad at 4 per cent., that railroad will not pay 5½ per cent. to a citizen of Massachusetts who wants the extra 1½ per cent. because he may be taxed."

Upon the subject of double taxation in the case of evidences of debt, the Commissioners use some illustrations which ought to make the matter plain to the humblest wayfaring man. They might very well be employed by teachers in the public schools, and are fitted to be of so much service in laboring with the benighted that we quote them for the convenience of such of our readers as are animated by the missionary spirit. Public opinion is more affected by arguments of this kind, perhaps, than by more elaborate disquisitions:

"To test the justice of the taxation of a piece of paper, such as a note, bond, or certificate of stock, we recommend the following experiment:

"Let the experimenter take a ten-dollar gold piece in his left hand. Let him write an I. O. U. ten dollars, and hold it in his right hand. Then exchange the two—get the gold piece in the right hand and the I. O. U. in the left.

"Are you ten dollars richer by this process? Are you rich enough in consequence to pay two taxes instead of one?

"Try the experiment with a friend. Let him hand you his I. O. U., and you hand him the gold. Are you two any richer? Do you two become able by this process to pay two taxes?

"Call in a third man. Hand him your I. O. U. for ten dollars, and your neighbor's I. O. U. for ten dollars as collateral. Are you three able, in consequence, to pay three taxes on the original ten dollars?"

When the law has once provided for the taxation of all land and all tangible personal property, it is obvious that further taxation of liens or claims upon such real and personal property is double taxation. It is undeniable that taxation of this kind is earnestly defended by many well-meaning men, who sincerely believe that the holders of evidences of debt who do not pay taxes upon them escape taxation altogether. But it is not true, as often said, that a large amount of personal property wholly escapes taxation; it is only true that it escapes the double taxation which the law attempts. The mistake is due to a confusion of thought arising out of the some

what mysterious functions of money and credit, and will probably continue until correct notions upon these subjects are generally accepted.

But there is a form of double taxation in Massachusetts which is indefensible upon any principle except that of the brute force of the State. If a resident of Massachusetts owns tangible personal property situated in another State, he must pay taxes upon it to Massachusetts, on the legal theory that personal property follows the residence of the owner, although he has also paid taxes on it where it was situated. But if the State of Massachusetts finds within its borders tangible personal property belonging to a non-resident, it taxes it upon the theory that it has not followed the residence of its owner. There is no confusion of thought about this, no mystification arising from the nature of *choses in action*, nothing but the bald fact that certain specific things shall pay twice the tax paid by other things of the same kind. This abuse is denounced by the Commissioners with appropriate severity.

In this respect other States are sinners as well as Massachusetts, but there is one iniquity peculiar to the law of that State. There has been provision since colonial days for the taxation of incomes arising from a profession, trade, or employment, but with the restriction that income derived from property subject to taxation shall be exempt. A comparatively recent decision, however, has declared this law to mean that a merchant is to be taxed not only on his stock in trade—without any deduction for his indebtedness therefor—but also for a part, if not the whole, of the income that he makes out of this stock, this income being supposed to be "derived" from the industry and skill of the merchant. It is hardly necessary to say that the merchants of Massachusetts do not concur with the Supreme Court, and commit what is technically perjury with clear consciences.

The abuses attacked by this Commission are inveterate, and it is not to be expected that they will be soon cured. Yet as, after a severe struggle, the taxation of mortgages on Massachusetts real estate has been done away with, there is nothing unreasonable in the hope that all forms of double taxation may yet be abolished. The example of Massachusetts is at present a hindrance and discouragement to reform in other States; and a recognition by her people of the injustice of their present laws would greatly stimulate those who are endeavoring elsewhere to make taxation more equitable in its methods and its incidence. This report is a step forward which indicates the existence of a sentiment likely to increase and eventually prevail.

PROFESSOR HILGARD.

JULIUS ERASMUS HILGARD, late Superintendent of the U. S. Coast Survey, who died in Washington on Friday, was born at Zweibrücken, Bavaria, January 7, 1825, and came to America with his father in 1835. The elder Hilgard, Theodor Erasmus, was a jurist of note in his own country, and devoted much of his leisure to belles-lettres. He settled with his family on a farm near Belleville, St. Clair County, Illinois, and was the first to introduce viticulture into the State. More important was his discovery, after careful experimentation with foreign vines, that the indigenous Catawba grape not only was best suited to the climate of the region, but was capable of producing wine of satisfactory quality. He gave personal attention to the education of his children, whom he instructed in languages and philosophy. Each of the sons, Julius, Theodore, and Eugene, has since attained honorable distinction.

The subject of this sketch began the study of engineering at Philadelphia in 1843, and two years later entered the service of the United States Coast Survey, then directed by the distinguished administrator, Alexander Dallas Bache. This organization, like most of our official scientific bureaus, was developed from a germ represented by a few lines in annual appropriation bills, which gave opportunity and scope to some person of genius. Such were Hassler and Bache, Henry and Baird, Gillis, Maury, and Hayden, to cite only some of those who have passed over to the majority. It is difficult to say whether such scientific success as has been reached by the Coast Survey, the Smithsonian Institution, the Fish Commission, the Naval Observatory, and the Geological Survey, could have been finally attained in any case, had the new-born infant been swaddled in so much red tape and hampered by such legal restrictions as are now thought necessary for the developed bureau. The presumption is against it; at all events there can be no doubt that, to the freedom of action left to the executive officer, with the opportunity for unlimited experiment in methods, control in promotion of subordinates, and the general exercise of expert judgment untrammelled by rules, is due the speed with which success has crowned the work of all of the above-mentioned organizations. Each represents the crystallized energies and life-work of some one or two leaders. The danger in each case lay in the changes inevitable at the death of the leader. If he had no competent and worthy successor, the very features leading to scientific success would afford an easy transition to degeneration and decay. It is a matter of history that, on the foundations laid in defiance of all obstacles by the audacious self-confidence of Hassler, the genius of Bache erected an organization whose world-wide reputation renders eulogy unnecessary.

A prime factor in securing the best endeavors of every subordinate was the explicit recognition of his particular services on every copy of the completed chart or in every annual report. No service, involving skill of brain or hand, was too humble for acknowledgment. Promotion was not attained by examinations or by favor, but by the tests of results in the work of the Survey. It rested with the Superintendent to raise the rate of pay, within certain limits, and it did not detract from the pleasure afforded by the approbation of the chief, to have it accompanied by an increase, even of a trifling sum, in the monthly remuneration. The system was avowedly lax in certain ways: men were supposed to be gentlemen, and not potential thieves; work was largely done "on honor." Faultless it was not; human nature in the Survey was much like human nature elsewhere. Grumbling and laziness were not unknown; but, all allowances made, the scientific world knows and has approved the results. Bache seemed to inspire his young men with a personal affection and something of his own genius for work.

Into this environment came young Hilgard. He began, like other civilians, at the bottom of the ladder, upon a temporary footing, as the original structure of the organization contemplated the survey of the coast by officers of the army and navy temporarily detailed to report to the Superintendent, and assisted by such civilians as were required from time to time. The continuity of work necessary to the attainment of the best scientific training was on this account possible only to the civilians in the service. By a process of selection from these, a small but able corps of workers gathered about Bache, among whom Hilgard soon took an honorable place, both as a student of his profession and in an executive capacity. He was enthusiastic, an indefatigable worker, alert in the recognition of all that was valuable in new methods, and, from his linguistic proficiency and wide reading, thoroughly informed on the progress of geodesy and engineering in foreign lands. A certain inborn mannerism of speech and gesture often impressed unfavorably persons whose knowledge of him was but superficial, but counted for nothing with those who were able to read more deeply the true character of the man.

The outbreak of the rebellion withdrew from the survey all military and naval officers, and checked on a large portion of the coast the progress of the ordinary work. A new and serious demand upon its resources arose which has been realized by few except those professionally engaged. Except to the Coast Survey men, the Southern coast, apart from a few harbors, was practically unknown. The charts were mostly still in manuscript. They must be kept out of the hands of the enemy and his blockade-runners, but the fleet must be supplied with quantities of transcripts. Coast-Survey men took soundings under fire on the bars from which the aids to navigation had been removed, and, as pilots, carried the men-of-war under the guns of Fort Fisher and led the fleet into Port Royal. The direction of the work was responsible, heavy, incessant; the anxiety, watchfulness, and care not less wearing than for the commander of an army corps. As one strong man after another went out into the field from the office, in time it came to Hilgard to act as principal executive officer to his chief under the designation of "assistant in charge of the office." At last the fine organization of Bache gave way under the strain. In 1863 a cloud settled upon his mind which never was lifted. Meanwhile Hilgard did double duty, inspired by equal loyalty to his country and his dying chief. As in time it became known that the state of Bache offered no hope of recovery, the question of a successor began to be discussed. We have learned from excellent authority that representations were made privately to Hilgard, with the assent of the appointing power, to the effect that the position was his if he chose to ask it. His answer was that he understood that the family of Bache were to some extent dependent on the salary of the Superintendent, and that, so long as Bache lived, he would do nothing which would prevent them from having it. Honorable to his friendship and disinterestedness as this course was, it cost him dear. Bache lingered through four weary years. At his death, long anticipated, several strong candidates were in the field, and, after an indecisive struggle of some length, all parties acquiesced in the appointment of Benjamin Peirce as the best method of restoring harmony.

Meanwhile the scientific abilities of Hilgard

and the results of his work had met with the approval of men of science. His work lay directly in the line of his profession, in the improvement of methods, the determination of weights and measures, and the novel method of ascertaining the differences of longitude by telegraph. His publications on these subjects are to be found chiefly in the Coast Survey Reports. One of the most noteworthy relates to the telegraphic determination of the differences of longitude between Greenwich, Paris, and Washington. He was a delegate to the International Metric Commission in 1872, and a member of the International Bureau of Weights and Measures of which he declined the directorship. He was an original member of the National Academy of Sciences, and for some years its Home Secretary. In 1874 he was elected President of the American Association for the Advancement of Science. He succeeded to the work of Bache in connection with the work of the Bureau of Weights and Measures, and took a leading part in preparing exact metric standards for distribution to the States and Territories.

The appointment of another, however worthy, when Peirce resigned the superintendency, was, without doubt, a severe disappointment to Hilgard. He already suffered physically from overwork, and death invaded his household, always tenderly united. However, he kept busy at his old post, in spite of weakness, grief, and adverse fortune. After the death of Mr. Patterson in 1881, he was appointed Superintendent, and, for a time, the tardy recognition seemed to give him new life. But his strength was broken, he suffered cruelly at times, and to those about him it was evident that his working days were nearly over. On the political changes of 1884, and their consequences to the Coast Survey, we shall not dwell. Those events are too recent to be impartially discussed. For Hilgard, prostrated by illness at the time, the severance of his relations with the organization to which he had devoted his life, was a crushing blow. The end, long in coming, was awaited with marvellous patience and met with Christian resignation.

The characteristics of the man partook somewhat of his father's poetic temperament. This sometimes led him, if his sympathies were excited, into hasty and ill-advised participation in other people's controversies. Thus he raised opponents and laid obstacles in his own path. The same element in his character was, however, responsible for the kindly charitable and self-sacrificing actions which, to those intimate with him, were known to adorn his unpretentious daily life. To this also may be ascribed the almost quixotic way in which he was known sometimes to aid the fortunes of his most active professional rivals; as if he had forgotten that self-preservation is the first law of nature. Now that death has swept away the fog of controversy, few of his former subordinates will be able to forget the kindness and consideration for their personal welfare characteristic of his administration, or to approve the manner in which that administration was brought to a close.

HERNE'S "MARGARET FLEMING."

BOSTON, May 10, 1891.

OF very much greater significance than the occasional presentation of an Ibsen play, whose momentary success as an exotic might be accounted for by the curiosity of the reading people of this continent to see for themselves what so stirred another, is the writing and presentation here of a native play of quite as advanced a type. This is what Boston has been witnessing during the past week, and will probably be able to do for a fortnight longer; for, although Chickering Hall is small, and his play appeals to a very limited audience, Mr. Herne has fortunately received enough encouragement already to extend his announced week to two.

His play was declared in advance by several critics to be far beyond the ordinary, Mr. Howells speaking with especial enthusiasm of it, and Mr. Barrett Wendell even writing a letter, in the daily of the Harvard students, to say that no one who was really interested in the stage could afford to miss hearing it. As a result, Mr. Herne's audiences have been exceedingly good ones, scholarly, interested, and critical, in spite of their numerical smallness. It is a pity for our stage that we have no Théâtre Libre, as Mr. Herne has just lamented in an after-dinner speech. No theatre-going public is less concerned than ours with serious drama, and no managers are so ready as the American to pander to bad taste with new extravagances of buffoonery. The "drama of the future," no doubt, will not be a paying venture at first, and a manager can scarcely be blamed for following the secure road of the present; but it is none the less a pity that a man who puts conscience and thought into his play should be compelled to produce it on the inadequate stage of a small concert-hall, and this is what Mr. Herne has had to do, in the absence of any small theatre, devoted to originality, where his talent might find a setting as well as a hearing.

The play itself is an attempt to dramatize the ordinary life of the American home—though the home selected is none of the happiest. Mr. Herne had previously written a play called "Drifting Apart," whose originality was hampered by the demands of melodramatic convention. In "Margaret Fleming" convention is cast to the winds, with a novelty of result that is inconceivable. The story is a familiar one. *Philip Fleming*, a manufacturer, is a small-witted, sensual man, luxuriously fond of his fine wife, his baby, and his home, yet beginning after his marriage, and with no compunction, a fresh liaison with a German mill-girl. The play opens with the crisis of this girl's motherhood before him, as well as an embarrassment with his creditors. In both extremities he acts with cowardice and meanness. The wrong towards the girl he tries to smother in her and himself with money; he anticipates his insolvency by settling his property on his wife and child. The wife, one of the high-minded women whose marriage to worthless men is a common source of surprise, refuses with handsome scorn to be a dishonest beneficiary, and spiritedly exacts of her husband that he shall meet his debts if he has to sell his house. This trouble she looks lightly upon; but she is not to be spared. The girl betrayed by her husband is dying; and *Mrs. Fleming*, at the request of her maid, the girl's sister, goes to visit her bedside, both being in ignorance of the betrayer's identity. Once there, there is the inevitable disclosure, which acts with such dreadful effect upon *Mrs. Fleming* that an hereditary trouble of her eyes is suddenly turned by the shock into total blindness. She sends for her husband, who arrives upon the scene just as she is preparing to give suck to the famished child of the dead woman—a climax as tragic as any that ever was put upon the stage.

Two additional acts add little to the strength of the piece. *Fleming*, with characteristic cowardice, has run away from home and taken to drink, emerging, much chastened, from a hospital where he has been brought by brain-fever. The wife's blindness is followed by temporary insanity; and, on her discharge from the asylum, her child and husband have both disappeared. (It is but just to add that this is told, not acted, on the stage.) The child has been stolen, out of revenge, by the German nurse-girl, who is leading it a life of misery in the North End; and its subsequent recovery involves the bringing of husband and wife together again in a police station, where the latter, without bitterness, but without emotion, refuses to return to a marriage which she declares, "without having asked the assent of Church or State," to be dissolved, and delivers a forcible, if somewhat gratuitous, lecture on unchastity to her contrite husband.

This is the story, very briefly. Action, as we understand it on the stage, is absolutely wanting; situations, almost wholly. Yet the interest is intense. The scenic accompaniment—the absence of supernumeraries—was naïf almost to a comical degree; but it detracted little from the interest in the play itself—a real interest, because the play was real. Its language was that of every-day life, the lines of the wife and the doctor alone having anything declamatory in them. It had, too, not only the verisimilitude, but the terrible frankness of speech called out by a great moral stress—all the indignation of outraged integrity and the cringings of cowardice; it was not pruned for recital. A comic element, in the person of a philosophic peddler, *Joe Fletcher*, the nurse girl *Maria's* husband, was well rendered, even if superfluously, by the author; while the part adds nothing necessary to the story, this compound of Sam Slick and Jacques Strop is a most accurate character study in himself.

The modern drift towards realism was noticeable all through in minor touches—the scene at the telephone, where *Fleming's* wife is supposed to be holding up the baby at the other end for him to talk to in his office; the itinerant sidewalk vender; the North End store, with its wretched customers; and the fine touch of the visiting lady from the "Fresh Air" Committee. But a more striking example of the gap between the ancients and the moderns is the part which the doctor plays in this piece. To be sure, in our modern plays, the medical profession is seldom treated with disrespect, and a better tribute to its humane tendency since the cupping and blood-letting era could scarcely be asked; but in Mr. Herne's play the doctor becomes something more—he is the moral adviser, the spiritual consoler, by virtue of his gentle calling. He points out the cringing *Fleming's* duty to him in language more forcible than agreeable; he soothes the sick wife, and would save her, if he could, from her misery, before and after the tragedy. In short, he shows how completely we have left the past where Doctor Pangloss exemplified the popular distrust of his profession, and some platitudinous old Vicar (the *deus ex machinâ* to calm the jarring elements) the respect paid to his. In this play there is no reference to the clergy, or even to God, except where *Mrs. Fleming*, as before quoted, denies that either can bind her to a marriage dissolved *per se*.

In acting, Mrs. Herne easily bore off first honors. Her home-life, with her husband, with her baby, with her maid, was the picture of a sweet wife and a good mother. Her reproach to her husband for his shifty money-dealing was simple and earnest; but the never-to-be-forgotten scene in the house of the dead girl, her magnificent dignity and forced composure under her sufferings, her skill in

dealing with her superserviceable doctor and infuriated maid, while herself almost distraught, and the pathos of her maternal yielding to the cries of her husband's starving bastard, was masterly. Her voice is a very beautiful one, not unlike Bernhardt's (to whom, by the way, she has a slight facial resemblance). Mr. Herne's *Joe Fletcher* was unctuous and amusing, Mr. Carter's *Dr. Larkin* very spirited, and the remainder of the company acted at least with earnestness.

Whatever may be said of the necessity for reshaping "Margaret Fleming," of its unfitness to be presented on the great stage—at least of its undoubted unsuitability as food for the "young person"—of its total lack of resemblance to anything ever played before, it marks, none the less, the beginning of a new epoch in the American stage, the success or failure of which the next generation will know.

L. McK. G.

TALLEYRAND'S MEMOIRS.—V.

PARIS, April 29, 1891.

THE second volume of the Memoirs of Talleyrand ends with the Congress of Vienna, and this period may be considered as the test of the abilities of the famous diplomat. Hitherto, his task had been somewhat easy, as he had nothing to do but to consolidate the effect of great victories won by Napoleon. Now he represented France vanquished and invaded; he fortunately represented also a principle which helped him to make an appeal to the feelings of all the sovereigns—the principle of legitimacy.

He arrived in Vienna on the 23d of September, 1814, and immediately called on all the members of the diplomatic body. He saw Lord Castlereagh, Prince Hardenberg, Humboldt, Nesselrode, Metternich, Gentz. He was long and deliberate in taking his position. At the first sitting of the Congress, Prince Metternich and Prince Hardenberg spoke of the intentions of the *allied* Powers. He interrupted them with some warmth: "Allies," exclaimed he, "and against whom? Not against Napoleon, he is at Elba. . . . It cannot be against France, peace is signed. . . . It cannot be against the King of France, he is the guarantor of this peace. Gentlemen, let us speak with frankness; if there are still allied Powers, I have no place here." And, after a moment, he added: "And still, if I were not here, I should be much missed. I am, perhaps, the only one here who will ask nothing. I only claim much consideration for France. . . . The presence of a minister of Louis XVIII. consecrates here the principle on which reposes all social order. The greatest need of Europe is the banishment of the opinion that you can gain rights by mere conquest, and a revival of the sacred principle of *legitimacy*, which is the fountain of order and of stability."

It is necessary to show what Talleyrand meant exactly by the principle of legitimacy, because he did not understand it in the narrow sense in which it is often understood by the French Legitimists. He says in his Memoirs (vol. ii., p. 159): "I speak of the legitimacy of governments in general, whatever their form may be, and not of the legitimacy of kings alone, for it ought to apply to all governments. A legitimate government, whether it is monarchical or republican, hereditary or elective, aristocratic or democratic, is always the government of which the existence, the form, and the mode of action are consolidated and consecrated by a long succession of years, and I should like to say by a secular possession." It is only in consequence of this principle that, in an hereditary monarchy, the right of succession is confined to the persons of the reigning family; so much so that Machiavelli, in his 'Prince,' says "that the usurper can only establish solidly his power after he has taken the lives of all the members of the family which ruled by legitimacy."

When Talleyrand made an eloquent appeal at Vienna to the principle of legitimacy, he knew that he should touch a very sensitive chord and procure allies among the sovereigns. Saxony was in the hands of Prussia, and the Prussians meant to keep it; it was with the greatest difficulty that they gave it back to the King of Saxony, only obtaining from the King the voluntary cession of a portion of his territory. Talleyrand was chosen, with Metternich and the Duke of Wellington, as a deputation to persuade the King of Saxony, who was living at Pressburg, to make this cession. Russia, on her part, intended to keep the whole Duchy of Warsaw, but, through Talleyrand's influence, she renounced her pretensions. Prussia recovered a large portion of the Duchy, and Austria a few districts. "Polard," says Talleyrand, "remaining almost entire in the hands of Russia, would have been an object of continual uneasiness for Europe. It was important for its safety that two Powers, instead of one, always liable to lose what they possessed, should be, by the sentiment of a common danger, disposed to unite themselves on all occasions against the ambitious pretensions of Russia. The same interest became the strongest tie between them, and it is for this reason that France stood in this case by Prussia and Austria." What was to become of the kingdom of Naples, which Napoleon had given to Murat? Talleyrand could not abandon his principle of legitimacy in this case, and therefore he was obliged to abandon Murat. The kingdom was restored to Ferdinand IV. Switzerland was proclaimed independent and for ever neutral.

Notwithstanding all the disadvantages of France's position at the time, her representative succeeded in acquiring such an ascendancy in the deliberations that the most important questions were, partly at least, decided according to her views and her principles. During the Hundred Days and the ephemeral return of Napoleon, Louis XVIII., though he was at Ghent, exercised the same influence at Vienna as if he had been at the Tuileries. At Talleyrand's request, Europe made a solemn declaration against the usurper. "I called him so because that is what he was after his return from Elba." The final acts of the Congress having been signed, Talleyrand left Vienna for Ghent, and, on his arrival at Brussels, he learned the news of the battle of Waterloo from the mouth of the Prince de Condé.

The closing portion of the second volume of the Memoirs is filled with Talleyrand's correspondence at Vienna. His letters to Louis XVIII. relating his conversation with the Emperor Alexander are the most interesting of all. He had a singular ability in relating all the striking parts of a conversation and in summing up its conclusions. This part of the Memoirs, however, has been a little deflowered by the numerous works which have been published of late since the doors of our archives have been opened. The documents now published have been compared with the documents kept in our archives, and their coincidence has been well established; the only differences which could be pointed out are slight. Talleyrand employed secretaries, he corrected his despatches, he attached great importance to small shades of expression. It is not at all singular that the notes which he preserved for himself should show a trace of his changes; but, I repeat, the changes are all insignificant.

The question has been asked, What has become of the original Memoirs? Were they in the hands of Talleyrand himself, or in the keeping of his secretaries? Have they been preserved, and, if so, where are they? The manuscript which the Duc de Broglie is publishing just as he received it from the hands of the executors of M. Andral, is a copy of the Memoirs made by M. de Bacourt; is this copy an exact reproduction of the original manuscripts? Great discussions have taken place on these points. You probably scarcely know in America the name of "Gyp." Gyp writes little articles and books which are sometimes amusing and always flippant, and which give us the slang of the fast people, of the set which is now commonly called *fin de siècle*, a mixture of folly, impudence, and light depravity. The real name of Gyp is Madame de Martel, and she is the grandniece of M. de Bacourt. She has had herself interviewed on this question of the Memoirs, and says she remembers that in M. de Bacourt's house were the papers of Prince Talleyrand, an immense number of small copybooks. "In this disorder there was order; everything was classed, pinned, ticketed. My uncle, who spent eight consecutive years in a perpetual tête-à-tête with these papers, knew what they contained, and moved with singular ease in this intellectual Capernaum." Madame de Martel and her mother helped M. de Bacourt copy certain documents. "He reserved for himself the notes of the Prince." M. de Bacourt had become the real proprietor of all these papers. Talleyrand left them in his will to his niece, Madame de Dino, charging her to intrust their publication to M. de Bacourt. She accordingly left them in her will to this diplomat.

Madame de Martel says that Talleyrand was a sort of demigod in the eyes of M. de Bacourt. "Never would my uncle have suppressed a phrase or changed a word in the notes of the Prince. He classified, copied, and that was all; and all this work was done without a secretary." M. de Bacourt died in 1865, at Nancy, appointing as his executors MM. Andral and Chatelain. They went to Nancy and took possession of the four volumes, bound in calf, which contained the copy made by M. de Bacourt, and which is now being published by the Duc de Broglie. The unimpeachable character of the Duke is a great security; it is certain, as he says so, that we have now the exact reproduction of the copy made by De Bacourt such as he left it. Nobody doubts that the Duc de Broglie has published all that he has received; but M. de Bacourt may have received verbally from Talleyrand himself permission to make some suppressions. M. Paul Andral was a most honorable man, a good lawyer, but not a literary man; his only object seems to have been, for some reason which we do not know, to delay the publication of the Memoirs; at the same time, in confiding their publication to a literary man, to an historian, to the Duc de Broglie, he took the best means of giving a perfect guarantee to the public.

On the whole, the noise which has been made over this question of the authenticity of the Memoirs seems to me to have been quite useless. The Memoirs have in themselves the proof of their authenticity. Talleyrand lives in them, with his curious shades of character and of thought, his singular mixture of fixed ideas and of flexibility of resolution, of solidity and of fluidity. Even the negligent style of some

parts, even the small errors of fact, which might have been so easily corrected, are a guarantee. More striking than these small negligences and errors are the enormous omissions; there are great periods which seem quite forgotten. But here again the omissions are proofs of the authenticity of the Memoirs. For some reason or other, it did not please Talleyrand to speak of some periods, of some events, of some men; his silence is significant. Many of the mysteries covered by this silence will probably be explained in the succeeding volumes. We wait for them with the greatest impatience, and we have little doubt that, like the present volumes, they will form a most important contribution to the historical literature of our age.

Correspondence.

THE IMMIGRATION PROBLEM.

To the Editor of The Nation:

Sir: It has long been a conviction with me that the only political salvation for this country consisted in educating the children of both natives and immigrants. As has been well shown, it is manifestly impossible to apply any educational qualifications to adult immigrants coming to this country, desirable as it may be. The older folks we cannot touch, but the younger we can and must. In my school, which will perhaps serve as a type of a fairly heterogeneous community, about one-fourth are by birth Germans, one-fourth Irish, one-fourth Scandinavians, and the remainder Poles, English, French, and native Americans. The parents work mostly in rolling-mills, lumber-yards, and large factories. A large percentage of them speak English not at all, or very poorly. But their children, who mostly attend the public schools, can at the end of their course through the four years of primary and four years of grammar school (they generally avoid the high school), speak and write good English, and, more than that, have a fair knowledge of American history and political institutions. Beginning at the fourth year or grade, the supplementary reading, supplied by the city, is chiefly historical — of course simple and adapted to their mental strength. This historical reading continues through the fifth and sixth grades, until the seventh, when a regular text-book on American history is taken up and finished in the eighth. In the last half of the eighth year English history and a little civil government are taken up. Some political economy is, of course, brought in incidentally. The result is, that when these youngsters are ready for their diplomas, they can and do get up on their feet and talk rationally and intelligibly and fearlessly about the present and past of the United States, and it is a fair inference that at the end of about six or seven years they will cast their first votes as calmly and wisely as any native-born American.

To abolish or curtail universal manhood suffrage is an impossibility. As a nation we are committed to and must stand by that policy. Further immigration may be restricted, and stringent ballot laws may reduce fraud and intimidation among those adults who are now within the fold; but the future destiny of the United States lies in the training which the public school can give to the rising generation, especially that of foreign parentage. The aim of the public-school teacher, in Chicago at least, is to turn out intelligently patriotic citizens. I may be pardoned for saying that there is, all things considered, no more noble (and ill-paid) vocation. E. L. M.

South Chicago, May 5, 1891.

To the Editor of The Nation:

Sir: On reading your editorials in the *Nation* for April 16 and 30, I cannot but think that you have drawn the meshes of your proposed sieve too small. It seems to me that the favorable light in which immigration from Great Britain has always been looked upon in this country is because of the character of the Englishmen who in the Puritan migration settled New England. Most Americans seem to think that the immigrants whom we to-day receive from England are still "the siftings of a nation." But this, as shown by your correspondent in your number for April 30, is not the case. While I agree with you that unity of language does much to give stability to a nation, I do not think it so essential as unity of race and of racial ideas, if I may so speak. Now of the same race and possessing the same racial ideas as the English and ourselves is the entire Teutonic people, and I would suggest spreading the meshes of your sieve so as to let all such through.

In Minnesota we have, perhaps, a larger Scandinavian population than any other State, and we could not have more desirable immigrants than the thousands who are every year coming here. They are industrious, frugal, peaceful, and, unlike the immigrants from Great Britain, who, coming from a manufacturing and commercial country, settle in the towns and cities, largely settle in the country, and the highest ambition of most of them is the laudable one to own a farm and farm it. They quickly learn our language, and, save where they have settled in large communities, their children invariably speak English in their ordinary conversation. They have political thought, are not mobilized in any party, and they become American citizens, in the true sense of that term, in much less time, I think, than any other immigrants now coming to us.

With the popular feeling against Italians and Spaniards, and with the comparatively small vote cast by nationalities not Teutonic, I do not think that there would be any insurmountable difficulty in obtaining the passage of an act which would practically exclude all immigrants with the exception of those from Great Britain, Germany, and the Scandinavian countries. And this, in my humble opinion, would practically settle the immigration problem, for it is not a cessation of immigration which we need, but a regulation which will exclude all undesirable persons and classes of persons.—Yours respectfully, J. A. L.

Minneapolis, Minn., May 8, 1891.

Notes.

The Johns Hopkins University Library has just been made the recipient of the entire collection of MS. and other historical material of Mr. J. Thomas Scharf, the prolific author of State, city, and county histories. It is very rich in documents dating from early colonial times to the close of the late war. "In documents illustrating the history of the Southern States it is believed to be unrivalled," and the University is naturally prompted to make it the nucleus of a library of materials for authentic Southern history. "These records will not be merely stored away, but they will be arranged and made accessible, under proper restrictions, to writers or students of history." Moreover, the University will receive and deposit what the present owners do not wish to alienate permanently. We trust that prompt advantage will be taken of this opportunity by North and South alike.

J. B. Lippincott Co. have in press 'The Swiss Republic,' by Boyd Winchester, late U. S. Minister at Berne.

Dodd, Mead & Co. will publish, in connection with James R. Osgood, McIlvaine & Co., London, 'Intentions,' by Oscar Wilde.

Messrs. F. F. Burgin and Leon Barritt of the N. Y. *Press* are about to issue 'Engravings: How to Estimate their Cost,' with many pictorial examples, accounts of processes, etc.

Fords, Howard & Hulbert announce 'Beyond the Bourne: Reports by a Traveller Returned from the Undiscovered Country,' by Amos K. Fiske.

'In the Heart of the Storm,' by the author of 'The Silence of Dean Maitland,' is in the press of D. Appleton & Co.

A second edition, revised, of Wm. Harrison Clarke's 'The Civil-Service Law: A Defence of its Principles,' etc., is about to be issued by Charles T. Dillingham.

'The Coming Terror,' Robert Buchanan's new volume of essays, will have the imprint of the United States Book Co.

D. Lothrop Co., Boston, have in preparation 'Leaves from an Artist's Field-Book,' by Wedworth Wadsworth.

The fifth bound volume of the 'Century Dictionary' is a reminder that this noble undertaking is nearing its end, for the sixth and final volume will make its appearance in the autumn (The Century Company). Up to this point, or as far as the word *stroyl* in the vocabulary, the editors reckon that they have disposed of about 185,000 words; and the letter S, when finished, will occupy more space than any other—860 pages all told, or not far from the bulk of a whole volume. The editors remark on the distinctively literary character of this volume, by alphabetic chance. A glance at such titles as Reconstruction, Republican, Repudiation, Resolution, Secesh and Secession, Slavery, Stalwart, etc., will show no small proportion of American political-historical information. Our peculiar use of the substantive "record" is embalmed with a quotation from Bryce's 'American Commonwealth.' The illustrations continue to be abundant and of a high order; the typography a model for all dictionary-makers.

Under the title of 'Etudes Américaines,' Mr. Henri Gaullieur reprints four articles concerning this country which he contributed to the *Journal de Genève*, and which, though not quite free from some of the errors that foreigners are so apt to fall into when writing of the United States, afford a fairly correct picture, and evince a degree of familiarity with things American which only a long residence here could account for. It may be worth mentioning that the writer accepts as authoritative the work of Robert Anderson Wilson on the Conquest of Mexico, which was published in 1859, but which, by common consent on this side of the ocean, has been consigned to oblivion.

Very nearly one-half of the April number of *Nord und Süd* is taken up with the first instalment of a journal kept by Ferdinand Lassalle in 1840, when he was in his sixteenth year. Paul Lindau furnishes an introduction which raises expectations that are doomed to disappointment, unless, indeed, the concluding portion, to be published the following month, will justify the almost stilted language of the preface. The journal, as so far published,

reveals simply an offensively conceited, ill-tempered, and underbred boy, not particularly advanced in his studies and addicted to many objectionable habits and practices. The most interesting fact we learn is that the agitator's name was really Lassal, and that he Frenchified it by adding a final *le* in 1846 while living in Paris—a lamentable indication of petty vanity.

We are in receipt of numbers 34 and 35 of the Fourth Series of the *Anales de la Universidad Central del Ecuador*. This monthly bulletin of the Quito University is "devoted to the promotion of general education and the cultivation of the arts and sciences in Ecuador." The number of cases in which "R. P." precedes the names of contributors, and "S. J." follows them, is an indication of the extent to which the higher education of the country is under ecclesiastical control.

A sad interest attaches to the "Pedagogic Autobiography" which is the opening paper of the *Educational Review* for May. It was the last manuscript on which the late R. H. Quick was engaged at the time of his sudden death in March last, and was left unfinished. Its style is perfectly characteristic of the lamented author of 'Essays on Educational Reformers,' who was happily distinguished from the Dryasdust tribe of writers on education. Mr. Quick felt a scruple in complying with the request to write this paper, being "in the habit of protesting, in season and out of season, against the amount of time spent on periodicals." "Woe," he goes on to say, "to the man who, in the days of his youth and ignorance, tries to keep and even bind up a periodical!"

A handsome reprint from the Cambridge *Tribune* (Cambridge: W. H. Wheeler) gives the history of 'The Society for the Collegiate Instruction of Women, commonly called "The Harvard Annex."' The original work in science and history of some of the students has been very significant.

From the Laboratory of Physical Geography of Harvard College we have a paper, by S. M. Ballou, confuting Prof. Thomas Russell's theory of "cold waves."

In the current *Harvard Monthly*, Mr. Edwin H. Abbot takes up the subject of Harvard clubs. These have come into being at about the rate of one a year since 1865, when the State withdrew from all control of the college management. Mr. Abbot names twenty-one, scattered across the continent, with memberships ranging from 25 to 567 (New York); and there are several more with undeterminable memberships. He would have a standing committee on "Harvard Clubs and organizations of the alumni of the University schools," with a view to promoting intercourse of these clubs with one another and with the governing bodies of the University.

The *Cornell Sun*, the daily paper of the undergraduates, lately remarked in an argument for the erection of an observatory that "Cornell leads in every other branch of learning; her professors are the best in the country." To this claim a member of the original Faculty, Prof. Wilder, objects in the issue of May 6, that it "is not warranted for any institution," adding: "If those who constitute the peripatetic 'teams' would take the opportunity to witness such unexciting 'events' as the performance of the legitimate educational functions of the institutions which they visit, their absences might serve at least one useful end in broadening the views of their fellows and preventing the publication of boasts which—like some of the earlier announcements of our prospective achievements—merely bring deserved ridicule upon us."

No. 3 of the Occasional Lists of the Manchester (Eng.) Public Free Libraries is a catalogue of the collection of works on Short-hand, Spelling Reform, and Cryptography collected by the late John Eglington Bailey. It fills 44 pages in double columns.

Mr. W. M. Griswold has, as a professional guide to literature, performed no service better than in his "Descriptive Lists" of novels. He began with the class dealing with American country life; he has now issued a list for those portraying American city life, and another for "international novels." The method is the same in all: alphabetical arrangement by title, carefully chosen characterization from a reputable source, and index of titles, authors, and locality. We should also notice a very convenient indication of the year of publication, beside the publisher's name. We have before said, and we repeat, that these lists should be kept in quantity in all public libraries, to serve as a sieve for fiction-readers; while parents with growing children who frequent such libraries, would find the lists an invaluable check on indiscriminate reading.

Reviews and notices, news, and summaries of periodicals fill much the larger part of the *American Journal of Archæology* for December (Boston: Ginn & Co.). The brief leading paper is by Mr. A. S. Murray of the British Museum, on a vase of the Mycenæ type in the Abbott collection of the New York Historical Society, shown in a photographic plate. The discoveries at Platæa in 1890, under the auspices of the American School at Athens, are fully detailed and illustrated with a plan. An interesting debate takes place in the department of Correspondence between Prof. Charles H. Moore and Mr. A. L. Frothingham, jr., touching some alleged errors in the former's work on the 'Development and Character of Gothic Architecture.'

—In the May *Macmillan's*, Dr. Birkbeck Hill reminds us that the 16th of this month will be the hundredth anniversary of the publication of Boswell's Johnson, and he expresses a hope that the celebrated biographer will be remembered upon his centenary. The book and the man are so much one that the day of publication may fairly be treated as the author's birthday. Dr. Hill points out the unnoticed fact that the date was the anniversary of Boswell's meeting with Johnson, and uses it to illustrate the vein of sentiment in him which is also shown by his publishing his other two volumes upon his own birthday. It is too late to say anything new upon Boswell, and Dr. Hill attempts no more in his pleasant article than to show that the first of modern biographers, though he acknowledged a certain indebtedness to the example of Mason in his 'Life of Gray,' was truly the original inventor of his method; and, having made this claim, he reminds us of Boswell's failings, especially in his devotion to the bottle, and congratulates us that the book got itself written amid all the difficulties of its author's habits. He calls attention, also, to two striking facts: one, that this work is only one of the several excellent biographies of the century past which have preserved the author's name and go by it—we speak not of 'Johnson's Life,' but of 'Boswell'; the other, that, unlike Boswell's other books, it has never been translated. It would, perhaps, suffer the most of any English book in a foreign version. One cannot fancy the Doctor's most celebrated phrases and sayings in French, for example, and his personality would suffer as much as his English. Yet that no foreigner has tried to fail in the attempt to give some knowledge of a work so famous in English, is singular.

—In the remainder of the number we observe a very favorable notice of Théodore de Banville, by Mr. Arthur Symons, in which full justice is done to the light qualities of the French poet, and perhaps criticism has passed into that merely personal admiration which is now so often the substitute for judgment—it is so natural for the impressionist to become the egoist. A third literary paper is Mr. Saintsbury's brief history of the war songs of English verse, in which he gives the palm to Campbell among the moderns, and writes very sensibly by the way of the weakness of Campbell's other poetry. He mentions, of course, Drayton's fine poem on Agincourt, but a better example of the danger of verbal criticism by a man who is not a poet, could not easily be found than his expression of a wish that in the lines about the archers—

> "None from his fellow starts,
> But playing manly parts
> And like true English hearts
> Stuck close together"—

the poet had written *Shot close together;* "but why," he adds, "gild the lily?" The emendation is one of those stupidities that give to all criticism that pleasing touch of burlesque at which gods and poets laugh.

—On account of the serious attempt just now being made to revise the Westminster Confession, the Presbyterianism of the English Commonwealth naturally acquires a fresh interest. Consequently the 'Minutes of the Manchester Presbyterian Classis,' printed for the Chetham Society, and 'Materials for an Account of the Provincial Synod of the County of Lancaster,' privately printed, both being edited by W. A. Shaw, M.A., of Owens College, are quite worth the attention of students. It is to be remembered that these are not only the most important, but almost the only published records of this particular phase of English ecclesiastical history. Mr. Shaw has prefaced the Minutes with an able introduction sketching the origin of the Presbyterian experiment—a disastrous one, he thinks, so far as the normal development of the English Church was concerned. Among the instructive documents revealing the spirit and aims of the Presbyterian movement, not the least important are the records of ordinations, for the questions proposed and discussed by the candidates give us a glimpse of old-fashioned, belligerent, dogmatic Calvinism. For example, one candidate, "aged about 24 years," maintained the affirmative of *an gratia sit irresistibilis;* another the negative of *an fides justificans potest amitti;* still another the negative of *an Christus sit mortuus pro omnibus et singulis hominibus;* while a fourth was "approv'd" and "ordayn'd" for answering negatively *an Christianus magistratus potest legitime tolerare omnes religiones*—agreeing thus with eminent Catholic authorities.

—The 'Harvard Studies in Classical Philology' (Boston: Ginn & Co.) offer an inviting range of subjects, and are by no means confined to pure philology, for which American scholarship has been said to show a predilection. They include papers on the time and place of the "Feast of Trimalchio," on "Greek and Roman Barbers," on "An Inscribed Kotylos from Bœotia," and on "The Stage in Aristophanes," as well as discussions of such purely linguistic questions as "Gajus or Gaius?" (Prof. Allen), "Some Uses of Nec" (Prof. Greenough), "Nedum" (J. W. H. Walden),

"Some Constructions in Andocides" (Morris H. Morgan), and the "Participial Construction with τυγχάνειν and κυρεῖν" (Prof. J. R. Wheeler). Mr. Haley reviews in clear and business-like Latin, with great acuteness and research, the opinions of Studer, Franz, Teuffel, Bücheler, and Mommsen, as to the vexed question where Petronius intended to place the "Banquet" and at what period. Mr. Haley agrees with Mommsen in fixing the time of the Banquet about A. U. C. 740, after the death of Virgil and before the Consulate of Gallius and Censorius; he differs with Mommsen and agrees with Jannelli in placing the scene at Puteoli, instead of Cumæ. Prof. Greenough illustrates some peculiar uses of *nec*, in which it seems to be almost equivalent to *non*, by our vulgar English use of *either* and *neither*. Two street boys quarreling will say: "You're making faces at me," "I ain't neither." "You be too." The shade of meaning which *neither* gives in these sentences was probably felt in the Latin phrases *nec manifestum, res nec mancipi, nec procul aberat*, and in all similar cases, whether stereotyped or accidental. That is to say, in almost all such examples *nec* meant, and was felt to mean, more than *non*. Prof. Allen's paper corrects the conflicting testimony of the grammars, and shows, by an exhaustive summary of the testimony of the Greek and Latin poets as well as of inscriptions, that the earliest form of the proper name was Gauius; and that the trisyllabic pronunciation Gāius prevailed in Rome from as early as 190 B. C. till 100 A. D. or later. Prof. J. R. Wheeler's is one of those statistical investigations which sum up in a few tables the result of an enormous amount of labor, involving in the present instance the usage of nearly thirty authors and of Attic inscriptions with regard to combinations of τυγχάνειν and κυρεῖν. One inference drawn by Mr. Wheeler was first announced in Prof. Goodwin's latest edition of the 'Moods and Tenses,' and is here reinforced, viz, that in combination with the present or imperfect of these verbs, the aorist participle does not coincide with the time of the verb, but retains its own reference to past time. The learning of the antiquarian discussions is tempered by an agreeable style, and the layman is by no means barred from understanding and enjoying their general drift. The manners and customs of the classical barber, his wealth, his instruments, his fashions in cutting hair, and the vital question whether he ever used scissors, are conscientiously treated by Mr. Nicolson; and the gravity of the subject is relieved by anecdotes which reveal the pedigree of the modern barber, and of the latest jests about him that circulate in the daily papers. Of Prof. White's paper on "The Stage in Aristophanes," we must speak at another time.

—Recurring to the 'Dictionnaire Général de la Langue Française du commencement du XVIIe siècle jusqu'à nos jours,' of Messrs. Adolphe Hatzfeld, Arsène Darmesteter, and Antoine Thomas (Paris: Ch. Delagrave), we remark that the plan of this new dictionary, four parts of which have appeared, differs from that of the Academy and of Littré, both of which are much larger works. Messrs. Darmesteter and Hatzfeld intend their book to be a *dictionnaire raisonné* which shall exhibit all the changes the language has undergone during the past three centuries and state the causes of these changes. To attain this end the personal history of every word cited has to be traced and told. The magnitude of the work is therefore dependent in part upon the number of words to be admitted, and a rule had to be laid down for this purpose. It is thus formulated by the authors: "Words which have a fixed use in the spoken or written tongue." Consequently, neither localisms, except such as are known over a whole region, nor technical or scientific terms which have not been commonly accepted, are included, save in those rare cases when a local expression may elucidate a general one. But a large number of technical terms and of popular names of fauna and flora have been admitted, and the asterisk, which indicates that the word is not to be found in the last edition of the Academy's Dictionary, is of frequent occurrence. The word admitted, its etymology is next ascertained. The constant progress made in etymology has enabled the authors to include the latest facts bearing upon doubtful points, and in several cases has led them to differ markedly from their great model, Littré. When he gives an etymology as certain, or nearly so, Darmesteter and Hatzfeld sometimes either reject the derivation or state that it is yet uncertain. *Aller*, *bâbord*, *barre*, *bouée* will furnish examples of this. It is to be noted, also, that while words in use since the beginning of the seventeenth century alone form the subject of study, all forms anterior to that date are largely used to illustrate the sequence of etymological changes. This is in accord with the historical and logical method employed throughout, the principle of which in this particular case is, that, no matter how numerous and unlike the existing meanings of a word may be, they can all be traced back to one original signification. The tracing back involves enormous labor, but the result, as exhibited in the Dictionary, is at once most instructive and fascinating. A double chain of connected forms brings the word from its origin — itself indicated by date and quoted text whenever possible—down to the present day, on the one hand exhibiting its transformations in form, on the other its variations, and extensions in meaning. Examples which may readily be referred to are *à*, *aller*, *âme*, *ange* (from 'angel' to 'chain-shot'), *assiette*, *blanc*, *bouchon* (from 'a clump of wood' to 'fishing float').

—It will be understood from this that not only is the history of the word itself given, but necessarily the history of the workings of thought which compelled these changes. Thus an interesting field opens up. How did *gagner*, for instance, which originally meant 'to feed,' come to mean 'to acquire'? The process of evolution and extension in this and other cases is fully explained in the Introduction, and the general laws governing the extension or limitation of the meaning of words are illustrated by numerous references. Careful definition, in the opinion of the authors, will clear away all synonyms so called, for no two words have absolutely the same meaning. Having selected the word, ascertained its etymology, accurately defined its original signification, its present meaning, and all the different ones flowing from the first, the authors have to decide on the classification of these meanings. Carrying out their plan, they consider that every word of multiple signification constitutes a genus, the principal meanings species, and the subordinate ones varieties. The great advantage to a student, whether native or foreign, of this classification is patent after a first trial, as the leading thought which connects the various significations is plainly brought forward, and what is incomprehensible in the ordinary dictionary becomes absolutely clear in this. It is this method, the exact definition, the wise selection of examples, which makes the work so valuable and so welcome. Completed, as it will be, by the "Traité de la formation de la langue," which is to form part of the book, and in which the laws governing the transformations of words and their changes of meaning will be explained, the 'Dictionnaire Général' will be indispensable to all who would keep abreast of the times in the study of French. The type used is small, but clear, and, even without reference to the key, the signs used in subdivision of articles would be intelligible. The four parts issued contain, besides the Introduction (xxviii pp.) the whole of the letter A and to *brouette* in letter B.

—When Prof. Albrecht Penck was called from Munich to the chair of Geography in the University of Vienna several years ago, he established a serial entitled *Geographische Abhandlungen*, for the publication of advanced geographical essays. Four volumes have been issued, containing in all twelve monographs, among which are studies on the Glaciation of the Salzach District in the Eastern Alps, and Climatic Variations since 1700, by Prof. Brückner of Berne; the Distribution of Air Pressure over Middle and Southern Europe, by Prof. Hann of Vienna; the Cordillera of Merida, by Dr. W. Sievers, and others of the same original quality. The first number of the fifth volume contains three papers by students of Prof. Penck's in the Geographical Institute of the Vienna University. It is easy to see that there is nothing to compare with this advanced line of study in our universities, and, however well equipped we may be in other departments, there is still good reason for students to go abroad if they are geographically inclined. Prof. Penck contributes an account of the study of geography in his University from ancient times, when Master Rudger Dole von Ruremund lectured "de coelo et mundo" in 1391—500 years ago. A. Swarowsky studies the occurrence of ice in the Danube, F. Heiderich treats of the mean height of the continents and depth of the oceans, and L. Kurowski discusses the snow limit in the central Alps. Heiderich's paper is of the most general interest; his results are based on elaborate calculation from the best maps obtainable.

—These *Abhandlungen* are published by the active house of Ed. Hölzel of Vienna. From this press we have a number of notable works of geographic value, particularly in the way of excellent maps and diagrams. Of the former, we may instance Von Haardt's wall map of the Alps, including the entire system from the Mediterranean to the plains of Hungary, and a new map of Africa, by the same cartographer, for school use; and in the line of colored geographical diagrams Hölzel may certainly claim to have produced the best series yet published. They are seldom seen in this country, but were brought prominently to the attention of visitors at the Brooklyn Geographical Exhibition in March, where they occupied the greater part of a large rack. Speaking of this exhibition, we note that, thanks to a committee of the Appalachian Mountain Club of Boston, it has been reopened in that city in the Winslow Skating Rink. Plenty of space is secured for the fullest display of the maps, models, and other objects of this remarkable collection, and it promises to attract a good share of public notice till its close on May 30. The Boston School Board has given its approval to the plan of the exhibition, and has notified the teachers in the public schools of it. Other cities will watch with interest the success of this experiment in travelling exhi-

bitions, and during the coming fall it is likely that Philadelphia, Baltimore, and Washington will follow the example of Brooklyn and Boston.

EIGHTEENTH-CENTURY LETTERS.

Political and Social Letters of a Lady of the Eighteenth Century, 1721-1771. Edited by Emily F. D. Osborn. Dodd, Mead & Co. 1891.

THE letters which are published in this volume are from the same family papers that afforded lately the delightful correspondence of Dorothy Osborn, but they take up the story in a later generation. They are all from the hand of Mrs. Sarah Osborn, a daughter of Admiral Sir George Byng, created Viscount Torrington, and sister of the Admiral whose trial and execution for alleged bad conduct of the Minorca expedition make one of the most notorious instances of injustice in English history. She married, at the age of seventeen, Mr. John Osborn, eldest son of Sir John Osborn, and was thus by this connection a grandniece of Dorothy. Her husband died nine years later, and on the subsequent death of his father she became the guardian of the estate for her son, Sir Danvers, and managed it with great success during his minority. He in turn married, and died in 1753 in New York, where he had been appointed Governor, and left a son, Sir George, during whose minority Mrs. O born again had charge of the estate, and managed it with the same ability. She lived to see a great-grandson, and died at the age of eighty-two. The letters cover her whole active life, with considerable gaps, from 1721 to 1771, and were written to either her son or other members of the family.

The volume is very different from that which has given Dorothy Osborn a distinct place among historical Englishwomen. There is no such personality or vigor of intelligence and feeling in it, and the subjects are of less attractive matter. But it does afford an interior view of the affairs and interests of a woman of strong sense and force of character, and of the habits of living and thinking in the aristocratic society of the last century. A good portion of the contents concerns merely the business of a landed estate, its money matters, repairs, stock, refurnishing, and the like; but a considerable space is also occupied with such news of the city as Mrs. Osborn thought would be welcome to her relatives. She does not descend to anything that can be called gossip; her news is, nine-tenths of it, of marrying and giving in marriage and of politics. What is most striking in the first of these topics is the frankness with which the fortune of the bride and groom is regarded as the main point. The place of money in society is nakedly shown. The tone may be illustrated almost at random in the volume. Here is an instance: "This is Sir Cecils lucky year. His mother has dyed, by whom he has got £2,000 a year, he has also a place of £500 a year in y^e^ Ordanance, his son page to the Prince of Wales, and his daughter to be soon so well married." Or this: "Pit has the reversion of Lady Grandison's £9,000 a year if young Villiers her son dyes under age. He is inclynd to be wild, and has not had the small pox, and Pit is lucky. Therefore everyone concludes the Boy is to dye." The will of the second Duke of Manchester gives occasion for a sketch of how it was received at the old Duchess of Marlborough's, where the Duke's widow was staying:

"I saw a Lady yesterday, came piping hot from thence, left the old Dutches at cards, and exercising her Witt on y^e^ poor Duke's will, commends the Dutches who is in high favour at present, she has talkd so sensible and propper on the occasion. She is charmd with her, but the Will is her whole redicule, and since it is so, tis pitty he named his Dutches in it. He has left her £300 for mourning, which is not 3 pence, her watch and jewels for life, and after to his brother. This is set out by saying y^e^ watch cost I forget what, when she married in her youth. She has broke it and changd it away for one that cost but £14. The baubles of jewels are set in the same light, but the great Joke of all is the Sedan chair, which cost £30 at her weding, and now not worth £4 . . . Dutches Marlborough says he has left his Dutches and all his Serv^t^ a half year's wages for £360 was half a year's pin mony . . . However I well remember how they treated the Duke of Bedfords character when his Dutches died, and therefore am not astonished to hear the same now."

Whether the subject be death or marriage, the comment is altogether the same, and who is to have and how much, are the questions. There are, however, many items that show a moderate scale of living in several particulars. Mrs. Osborn states her own expense for eatables, for herself and five servants, "exclusive of Beer, Coals, Candles, Tea, Coffee, Sugar, Wine and several other articles which slip in to Housekeeping" at only 30 shillings a week; wages of servants are very low; and she writes to her grandson Jack that he can live like a gentleman in London on £320 to £340 a year.

Next to the expense side of life, with the kindred financial interest of marriage and death, the subject of politics and changes of the time in manners and morals holds the second place. The panic in London at the rebellion of 1745 is the most important historical event of which there is contemporary reminiscence, and then it is but a slight one:

"Wednesday last was the most dismal day I ever knew, it being believed here it was the day of Batle, not only myself but every mortal in terror for their ffriends. . . . By ffryday these fears were over, and others succeeded which seizd indeed the whole Town, and was, I must say, a most shameful Panick, but the express that came had that effect upon all sorts of people. . . . Thousands of the Pretender's Declarations were threw about the Park and streets, every woman thinking where to run for safty, and every man getting Arms and Horses to go with the King, Brother Torrington among the rest. Lord Shannon was so good to take me and my children to Ashly, thinking cross the water most safe. I found a place to hide what was nessessary. Dr. Osborn was in town, thought it high time to remove the things from Chicksands. He went down that morning before the consternation was so great and sent Thomas Green with your two Boxes a Sunday, which are now here, and £100 for Denbigh. I beggd the plate to be burried anywhere near him, for imposible to trust that road by the Wagon since we imagind the Highlanders would be at their heals."

Other matters touched upon are the growing expenses of elections, and particularly the "spendthrift election" in which her grandson, Sir George, stood, and the degeneracy of the Parliament. Mrs. Osborn was connected with Lord Halifax, whose sister her son married, and therefore was interested with the Opposition. She more than once laments the change from the political ties of family connection to those of personal advantage, saying that honor and faith and friendship may be scratched out of the dictionary as words of no meaning; and in 1767 she notes the end of the old régime. "It is said two millions will be spent in elections, £20 and £30,000 comes out of every purse. Nabobs, Contractors, Silversmiths, Bankrupts are in high luck, there will hardly be 200 real gentlemen in the House. The landed Interest died with the last Parliament." She observes, also, that hardening of manners by a colder demeanor in the expression of personal feeling which came in towards the second quarter of the century, and refers more than once to her own affectionateness as old-fashioned. Thus, on reading over some old letters, she writes to her son about them:

"Some from my father with such tenderness and esteme for you that I must still preserve them for your perusal, and tho it may be ffashion to explode such tenderness and humanity as I have lately been reading, yet I thank God for having been born in the days when such passions were praiseworthy, and having received the Benefit of them from my ffriends, for it surprises me to collect together the heap of civilitys and kindness I have received, and the great want I was in of them. . . . My latter days have been so much happier that I had forgot how I strugled in Life in my youth, till this leisure time has refreshed my memory."

Another trait of the times comes out in a few words on the neglect of education of gentlemen's sons. Her standard was certainly low enough: "For Godsake let all boys have a pproper school till 12 year old at least. Tis terible to think when they are Captains y^t^ it will be a shame for them to write to the Admiralty. Poor boys, tis sad when no one belonging to them think Learning is necessary. I even am come to think if they are to be Coblers they should first go to Westminster." Toward the close of her life the increase in the style of living gave her some concern, and she seems to despair of her country as much for extravagance as for political degeneration. "Everybody is undone in England," she writes in 1767; "every day produces new distresses, the immense expense of the Hunting gentlemen makes horses and hounds a drug that must be sold, an infatuation runs through the whole plan of living, and insted of being happy, everyone has made themselves miserable and must all transport themselves to America."

Mrs. Osborne, however, though she took this discouraged view of affairs and praised the old days, lost no interest in the welfare of her grandchildren, and it is plain to see that care for them was the motive of her whole active and energetic life, and her attachment to them the only thing that called out these letters. She was devoted, indeed, to her entire family, and when the great trial of her life came in the execution of her brother, Admiral Byng, she, being then his only surviving near relative, did all that was possible in the way of appeal to her friends. None of the correspondence of that period is left except her letters to the Duke of Bedford and to the Lords of the Admiralty, excellent in form and tone. The letter of Voltaire, enclosing one from the Duc de Richelieu, who commanded the forces at Minorca, and gave his testimony to the probability that, if the Admiral had attacked, he would have been completely defeated, is also included in the account of this episode; but the most important documents are the manly statement of the Admiral himself, written just before his execution, and a brief letter of thanks and of affection to his sister. She discharged her duty equally well, however, in less marked situations, and a strong mind and faithful heart are revealed everywhere in these rather dry and bald memorials of her. The last letter she wrote contains this sentence: "I am ever full of a thankful remembrance of God's goodness to me in the most essential point of life, to have been made happy, and very uncommon to be so two generations together." She was quite ready to leave the scene long before the end came, but for one who had lost her husband early in life and all her children and a brother under such

distressing circumstances, and had been burdened with much care most of her days, this was a very cheerful farewell.

JOHN DICKINSON'S CASE.—I.

The Life and Times of John Dickinson. 1732–1808. Prepared at the request of the Historical Society of Pennsylvania by Charles J. Stillé, LL.D. Philadelphia: J. B. Lippincott Co. 1891.

THE name of John Dickinson might almost deserve to find a place in Friedrich Bülau's curious cyclopædia of 'Enigmatical Men,' so obscure was the mixture of the elements which entered into his mental make-up, and so divergent have been the historical judgments pronounced on his character as a man and a statesman. Revered for a time as the foremost of American civilians, and dividing with James Otis the honors of intellectual gladiatorship in the first opposition that was waged against the Stamp Act and kindred aggressions of the British Government; wielding a vast erudition in the service of the popular cause, and lauded by patriots throughout all the colonies as a man of excellent heart, of transparent probity, and of inflexible rectitude, he subsequently fell from this high estate as the dispute with the mother country waxed hotter and hotter, until at last, on his open refusal to face the dread issue presented by the Declaration of Independence, he was doomed to hear himself denounced as a "piddling genius," as a man of "weak nerves," as a tame and spiritless creature, as the vassal of the Proprietary interest in Pennsylvania, as a craven who failed to act a man's part because he was henpecked by wife and mother, as a sordid recreant who faltered in the path of patriotism because he feared for the safety of his great fortune, as a victim of boundless ambition without courage enough to back it, and, finally, as a soldier who showed the white feather in the presence of the enemy. Even his physical traits—his hectic complexion, the ashen pallor of his visage, and his defective eyesight—did not escape the taunt and sneer of his embittered opponents. It is evident at a glance that any study in the biography of such a man must be at the same time a study in psychological analysis.

It is admitted by Dr. Stillé that Dickinson was always an intense conservative, and had a horror of any change brought about by revolutionary means; that he had a natural hesitation which he never quite overcame, and which sometimes damaged his reputation even when he hesitated at the right time and place; that rather than be a "revolutionist," he was sometimes over-ready to be a "prophet of evil"; that in his policy of pacification on the eve of the Declaration of Independence he was mistaken in his calculations and disappointed in his expectations; and, finally, that he was too distrustful of the people, and was wanting as well in enterprise as in confidence. Yet with all these admissions it is contended that the failings of Dickinson leaned to virtue's side, because they were always inspired by a self-denying sense of duty, and by a zeal for country which not only ate up all pride of personal ambition, but even made their subject willing to offer himself as a living sacrifice on the altar of patriotism—in short, that he acted at all times with the magnanimity of a large-souled and true-hearted statesman, and displayed in critical conjunctures the dauntless spirit of a Cato, who pleased himself with the conquered cause even when the conquering cause had proved pleasing to the gods.

The briefest record of Dickinson's conspicuous career will suffice to show how it is that a species of historical enigma has come to complicate itself with his name and fame in American annals. Born on the 8th of November, 1732, he was bred to the profession of law and studied at the Middle Temple in London with men like Thurlow and Kenyon for his associates. He early rose to distinction at the bar, and, combining an enlightened public spirit with his legal practice, he was elected a member of the Legislature of Delaware in 1760. In 1762 he was chosen to a seat in the Assembly of Pennsylvania, for at that time so intimate was the connection between Pennsylvania and "the Lower Counties," as Delaware was called, that, besides having the same Proprietary Governor, there was often an interchange of public men between the two colonies. As a member of the Pennsylvania Assembly he was a strong supporter of the Proprietary interest, not because he loved the Proprietary family more, but because he trusted less to the intrusion of the Crown in colonial affairs. The passage of the "Sugar Bill" and of the "Stamp Act" soon came to justify his political foresight. In 1765 he published an able pamphlet on these oppressive regulations of the mother country. In the same year he was sent by the Pennsylvania Assembly as its delegate to the Stamp Act Congress which met in New York city on the 7th of October, 1765, and he drafted in that body the resolutions which, as amended and finally passed, were accepted by the patriots of that day as a genuine Bill of Rights on which to base American resistance to Parliamentary usurpations. In 1767–'68 he issued the famous "Farmer's Letters," a series which more than any other publication helped to consolidate public opinion in favor of organized resistance to the British Ministry. In 1771 he drafted the Petition addressed by the Pennsylvania Legislature to the King. In 1774 he was appointed Chairman of the Philadelphia Committee of Correspondence on Colonial Grievances, and in the same year became a member of the first Continental Congress. He drafted in that body the Petition to the King and the Address to the People of Canada. In 1775 he was made Chairman of the Philadelphia Committee of Safety and Defence. In the same year he was elected Colonel of the first battalion raised in Philadelphia for the military defence of the Colonies. In the month of July, 1775, such was his influence in the Continental Congress that he carried through that body a Second Petition to the King in spite of the earnest opposition of the New England delegates. A little later he drafted for the Congress its Declaration of the Causes for Taking up Arms.

Meanwhile, however, he steadfastly opposed the revolutionary agitation organized in Pennsylvania for the overthrow of the Proprietary Government. He strenuously resisted the passage of the Declaration of Independence, on the ground, as he afterwards alleged, that it was premature, in the absence of any organic bond of union among the colonies and in the absence of foreign alliances. On the 12th of July, 1776, he reported to Congress the first draft of a Federal Constitution for the united colonies. Shortly after the Declaration of Independence he was superseded in his military promotion at an irregular election of the volunteer soldiery, voting in disgust at his defection from the cause of independence; and when this irregular election was approved by the revolutionary Convention which had displaced the Proprietary Government, he resigned his military command, as well for civil as for military reasons. The revolutionary Convention refused at the same time to reappoint him as a delegate to the Continental Congress. Elected, notwithstanding his reactionary opinions, to a seat in the revolutionary Assembly, he refused to act with that body, except on conditions which required it to discredit its own right of existence. Retiring to his farm in Delaware, he was elected by that State in November, 1776, to a seat in the Continental Congress, from which he had been exiled by the act of the Pennsylvania Assembly. "He absolutely declined this honor without assigning any reason for the refusal."

He now regarded his civil career as at an end. In 1777 he served as a private in the battle of Brandywine. In the autumn of that same year he was appointed Brigadier-General of the Delaware militia. Elected by Delaware to the Continental Congress early in 1779, he consented to resume his seat in that body on the 23d of May in that year. Appointed Chairman of the Committee raised to prepare an address to the States on the perilous condition of the public finances, he drafted the paper which was issued on this subject by the Congress, being the fifth of the great Revolutionary state papers which emanated from his skilful pen. In the latter part of 1779 he resigned his seat, in apparent weariness of public office, and retired again to his farm. In 1781 he was elected a member of the Supreme Executive Council of Delaware, and shortly afterwards was made its President, both of these offices being "literally forced upon him." In 1782 he was elected a member of the Executive Council of Pennsylvania, and by act of the Assembly was appointed President of the Council in November of that year. He then for the first time overcame his scruples and took the oath of allegiance to the Revolutionary Constitution. His return to office in Pennsylvania as the most conspicuous representative of the "Anti-Constitutionalists," or "Republicans," as they were called in the Pennsylvania politics of that day, was signalized by the most virulent assaults on his personal, his political, and his military character; but, in spite of these assaults, such was the confidence in his integrity that he was twice reëlected to the same office, and that unanimously. He was sent to Annapolis in 1786 to confer with the State Commissioners appointed to take measures for a revision of the Articles of Confederation, was made President of that Conference, and was deputed by its members to draw up the report which stimulated Congress to initiate the steps it took for a change in the Federal Constitution.

He sat in the Federal Convention of 1787 as a delegate from Delaware, and had a leading part in framing that clause of the Constitution which provides for the equality of the States in the Senate. In a series of notable essays, under the signature of "Fabius," he earnestly advocated the ratification of the Constitution while it was pending before the States. He held no office under the instrument he had helped to frame, but continued to take an interest in politics. In his political principles he was a friend and adherent of Jefferson. He drafted a bill for the gradual abolition of slavery in Delaware, but nothing came of it. In 1804 he advocated the restriction of slavery in the newly acquired territory of Louisiana. He died on the 14th of February, 1808. On learning of his death, Jefferson wrote of him as follows: "A more estimable man or truer patriot could not have left us. Among the first of the advocates for the rights of his country when assailed by Great Britain, he

continued to the last the orthodox advocate of the true principles of our new government, and his name will be consecrated in history as one of the great worthies of the Revolution."

Architecture of the Renaissance in England. Illustrated by a series of views and details from buildings erected between the years 1560–1630, with historical and critical text. By J. Alfred Gotch, F.R.I.B.A., assisted by W. Talbot Brown, A.R.I.B.A. London: B. T. Batsford; Boston: Ticknor & Co. 1891.

It cannot be said that English architecture has shown to advantage in any kind of classic dress. The classic qualities—fineness of proportion, dignified elegance, repose, subjugation of detail—are not those to which it seems born. The charms that sit naturally upon it—vivacity, picturesqueness, the free expression of individual humor or need—these have been stifled whenever it has been submitted to classic form. It does not, like the Italian, wear the yoke with freedom and grace; when it becomes formal it becomes dull. The most that can be said for the English Renaissance, by which is here meant the style of Elizabeth's reign and the following years up to the time of Inigo Jones, is that it was better than that which it displaced. The transition to the classic came when architecture in England was at the lowest ebb of tastelessness and poverty of design. The dryness, the irregularity without picturesqueness, the stiffness without dignity of late Tudor architecture were not a happy preparation for the classic revival. So it is not strange that the English Renaissance lacked the elegance of the Italian and the French; and if it has not the coarseness of the Dutch, it fails of the picturesqueness of the German. To recognize the difference of the soils in which the classic seed was sown we need only compare, for instance, the church of St. Wolfram at Abbeville with an English parish church of the beginning of the sixteenth century.

Nevertheless, it is worth while to put the English on record, for it has its artistic value and its historic interest; and though Richardson and Nash and others in their degree have given us a good many examples of it, nothing has been done with much fulness, nor with the precision of modern reproductions. It is purely domestic, for the early Protestants had no need to build churches, and of other public building there was in England at that time but little. The charm of English domestic architecture, to be sure, lies very much in its expression of home-like comfort, its immediate surroundings, and its adaptation to them—things not strictly architectural. But its qualities are its own; they are English if nothing else, and are peculiarly adapted to English ways of life, and so to American. Therefore, Elizabethan architecture has been a quarry for American builders. Its detail, mechanical and rather petty as it is, is easy of execution by fairly skilled workmen. It does not need the artistic turn of a French or Italian mechanic to do it justice, and it lent itself very kindly to the national jig-saw. It is, indeed, that quality of detail which one might expect to find where workmen, capable but not artistic, were cut loose from their own habits, and set, as they were at that time in England, to carry out a new style under the general guidance of foreigners or foreign fashions, but without minute supervision or the inspiration of direct example. It was rather rude, mechanical, only half appropriate to the style for which it was intended; but it was easily comprehended and executed—just the detail that can be learned from books. The English workman had lost the art of carving; the English architect had not the fine sense of form and proportion that distinguished the Italian and French. It is not strange that their minds worked uneasily under the constraint, that classic features were strained out of shape, that details were coarse and mechanical; that façades were dull and commonplace up to the cornices, but above, where the shackles of classic example were left behind, they blossomed out into untamed extravagance, in turrets, obelisks, arches without spandrels, chimneys composed of coupled columns, parapets of straggling scroll-work.

Mr. Gotch's work is a collection of folio prints, mostly phototypes from nature, but partly from very clear and straightforward drawings by Mr. Brown, with descriptive text. Part I., the first of six, contains illustrations of sixteen buildings, some conspicuous and famous, like Burghley House (more commonly known, we suspect, as Burleigh House) or Haddon, and others less known. The author has not attempted to illustrate any completely, but rather to give a series of suggestive plates, and the result is necessarily a little desultory. We hope that, as he goes on, he will illustrate the text freely with plans. Sketch-plans and outline views cost little in space or money: they save the interested reader much hunting, commonly vain hunting, in other authorities, and a feeling of unsatisfied curiosity which is akin to dissatisfaction; they go far, also, to correct the air of scrappiness which is the common blemish of books of this kind. The most attractive of the buildings here are, perhaps, not the most important. Burghley House, a stately, rather picturesque, but uneasy design of Thorpe, bristling with turrets and chimneys, challenges not too favorable comparison with the nearly contemporary châteaux of Chambord and Chenonceau. "Hardwicke Hall, more glass than wall," as Mr. Gotch aptly quotes, is a dreary pile, and its state bedroom, but for a bit of finer detail here and there, might pass for a burlesque design. Park Hall is a half-timbered house, resolutely picturesque. The older part, also half-timbered, of Hall i' th' Wood, is charming in spite of its dilapidation, with a breadth and nice proportion that are wanting in more ambitious examples. The tombs of Burghley and Leicester, and the curious sentry-box doorway in Broughton Castle, show an unusual care for proportion, and in parts fineness of detail; but all are disfigured by the structures that surmount them. Apethorpe and Stibbington, with more breadth than most and less effort of design, show also more animation and yet more repose. This is due partly to better lighting of the plates, but also to happier composition. Stibbington has a very clever solution of the difficult problem of applying a bow-window to a gable.

The plates are well executed, but a little dull and wanting in accent. Some of them, apparently taken on gray days, suffer from the dry monotony of tint that is apt to pursue the phototype. Mr. Brown's drawings are just what they should be. Mr. Gotch's text is very good. His introduction is admirable—animated, interesting, judicious in tone, and true in criticism. It does not appear whether we have the whole of it in this first part; we wish there were more. On the whole, the publication is timely, valuable, and very well done. The only reason why it is not of unusual interest is to be found in the quality of the material of which it is made.

New York. [Historic Towns.] By Theodore Roosevelt. Longmans, Green & Co. 1891.

Mr. Roosevelt has made a very readable book; but it is not altogether a history of New York city. We need not maintain, with a certain sect, that a work of art must have no moral, and yet we must recognize that it is desirable to tell a story, whether true or fictitious, without making its lessons too obtrusive. Mr. Roosevelt preaches a little too much. He lays down the singular proposition that a feeling of broad, radical, and intense Americanism is necessary if good work is to be done in any direction. Obviously he has been sickened by his familiarity with certain manifestations of provincialism, both past and present; but it is strange that this should have blinded him to the absurd provincialism of his maxim. Most people are not assailed by

> "—— temptations
> To belong to other nations."

They remain good Americans without ever thinking of it. To set "Americanism" as a supreme ideal is about as sure a way to produce bad work in any direction as could be devised. The sooner we get over talking about "American" systems of philosophy, and ethics, and art, and devote ourselves to the search for what is true, and right, and beautiful, the sooner we shall shake off our provincialism.

In truth, this remark of Mr. Roosevelt's may have been meant to appease the Chauvinists, for the story of New York, as he tells it, and as we fear it must be told, is not inspiring. The record is almost bare of glorious deeds, of lofty ideals, of elevating thoughts. The city was sordid when it was small, and sordid when it became great. No glamour of romance can be made to surround it. From a very early time it has been a mart, a place to buy and sell and get gain; and in this respect its past has been great and its future will be greater. But in civic life, such as gave Athens an imperishable name and made glorious the history of many mediæval towns, New York has always been deficient. It is not a mere "geographical expression," but it is hardly more than a commercial expression. The causes of this lack are clearly shown by Mr. Roosevelt. The city did not develop: it simply grew. Development was swamped by wave after wave of immigration, and, after it had been populated by those who came to it as a place for money-getting, it fell a victim to their parasites. The celebrated exclamation of Bücher, when he first beheld London, has been echoed by thousands of "legislators" both in and out of New York. The city has seldom been self-governing, and, after the tide of immigration fairly set in, it is doubtful if it was capable of self-government.

Mr. Roosevelt speaks with generous scorn of the narrow prejudice felt against immigrants by the descendants of immigrants. But the prejudice, though narrow, is rooted in the instinct of self-preservation. If a "community" is to develop, it must have a community of feelings and aims, based upon the mutual understanding of its members. A *colluvio gentium* is incapable of such an understanding. The chief merit of Mr. Roosevelt's sketch, so far as it relates to the history of the city of New York—for we think his digressions the best part of it—is the clearness with which he brings out the mongrel character of its population, and it is surprising that he should give so little consideration to the natural consequences of this feature.

The purely narrative portions of the history are very agreeably written, and leave the reader with the single regret that they are necessarily so much abbreviated. The opening is slightly marred by some affectation of archaic English and some leaning to alliteration, as in the sentence, "Their small ships dared

the dangers of the most distant oceans, and shattered the sea-might of every rival naval power; and they themselves led lives of stormy peril and strong pleasure"; but these blemishes soon disappear. The subject is really too large for the prescribed limits, and Mr. Roosevelt has perhaps done as well by a difficult piece of work as could have been done by any one.

The Evolution of Sex. By Prof. Patrick Geddes and J. Arthur Thomson. [The Contemporary Science Series.] Scribner & Welford. 1890. 8vo, pp. 315, 104 illustrations.

For several years the authors have been independently writing upon the theoretical side of biology, and now unite in adding one more to the adverse criticisms by scientific men upon Darwin's theory of sexual selection. The main points presented are that sexual selection is a minor rather than a major cause of sexual differentiation; that there are many varieties, especially in the male, which are not beautiful, conspicuous, or useful, which cannot aid the female in selection or decide the contest between rival males; that variations in their beginnings must have been slight, necessitating such a high degree of acuteness of vision and æsthetic taste in order to make the proper selection as to seem incredible; that colorings and markings occur in nature where it is not possible that they can be due to sexual selection. Darwin himself freely stated some of these objections, but, on the whole, considered sexual selection the most potent factor in the production of secondary sexual characters, while Wallace thinks that natural selection alone will account for the differences between the sexes.

Our authors consider that a more fundamental analysis of the question is demanded. As the basis for their constructive theory they cite the recent work of physiologists and chemists on the processes of protoplasmic growth, activity, and degeneration, grouped under the general name of metabolism, the upbuilding being due to anabolism, the tearing down to katabolism. With these two words to conjure with, they explain the most abstruse and puzzling phenomena of biology, though they do not deny to natural and sexual selection, function and environment, subordinate parts in organic evolution. The difference between the sexes in secondary characters is only the special expression of fundamental differences, caused by the more katabolic or destructive processes in the male, the more anabolic or nutritive processes in the female. Gaudy coloring, defensive weapons are expressions of overflowing, waste energy. The males are more variable, and "transmit more variations because they have more to transmit." The exceptional female cuckoo is explained on Eimer's hypothesis that her habit is only one expression of a consistent, self-seeking, active, voracious character, one in which katabolism predominates. The sexual elements are indicative of the difference between the sexes, the one large and quiescent, the other small and active. The sex itself of some individuals is supposed to be caused by the condition of nutrition at an early period, more females being produced under favorable conditions of heat, nutrition, etc.

With reference to the last point Minot says: "The relation of impeded nutrition to the development of sexual elements and the causation of sex needs investigation based on proper experiments." But, even on *a-priori* grounds, it seems that if a change of nutritive conditions can change the sex, there cannot be a fundamental difference in the protoplasmic constitution of the sexes, for protoplasm not only absorbs but assimilates what comes to it. Then, with regard to the size of animals, it is hardly made clear how katabolic activity can, among lower forms, produce males that are smaller than the females, and, at the same time, in the higher forms, reverse the relative proportions. Finally, while it might be conceded that the difference between the sexes lies in a difference of metabolism, the argument here presented only proves that the katabolism in males is less distinctly of a periodic or rhythmic character than in females.

The conclusion once reached that the difference between the sexes is fundamental, the question is raised as to the cause of that difference. Why has the more primitive and apparently more economical hermaphroditism so generally been replaced by conjugation or true fertilization in the dominant species? Recent experiments on very low forms are cited which accord with the common experience that close breeding tends to degeneration; but, after denial that "subsequent advantageousness" can explain the origin of sex, the question is left without an answer.

The human mind has come to distrust theories which are said to have universal application. Doubts are immediately excited when the theory outlined above is extended by the authors from the proper subject of the book to the more fundamental ones—the relations of growth, reproduction, and death. Especial attention is directed to the puzzling and anomalous matters connected with reproduction, hermaphroditism, alternation of generation, asexual multiplication, parthenogenesis, the extrusion of polar globules, and all are shown to be in perfect harmony with the main thesis, and all to be due to a greater or less degree of metabolism. The more favorable the conditions of nourishment and heat, the less likely is sexual reproduction to take place; but as soon as conditions occur which favor katobolic changes, "the organism defends itself by uniting its waning vigor with another." The inadequacy of this explanation is shown by a carefully stated observation of Weismann, that parthenogenesis is the rule in certain Daphnidæ during the spring and summer, when food is scarce, while in the warm autumn, food being abundant, sexual reproduction occurs.

The problems here treated are among those which always interest the acutest observers and thinkers, with the result that more energy is spent in thinking out and elaborating a theory than in taking a single fruitful field and gathering a ripe harvest of facts, so connected and complete as to give some real and permanent ground for advance. The methods of experiment and the criticism of observations are constantly becoming more rigorous. Naturally more confidence would be felt in a theory put forth by men who had, by a long series of published results, challenged severe counter criticism. The dictum of Foster, that "the whole story of proteid metabolism consists at present mostly of guesses and gaps," makes it evident that a theory based upon such an insecure foundation is far from that state when a complete theory of life and of ethics may safely be raised upon it as superstructure. Yet this is unhesitatingly done in the present work and put forth in popular form, and from it are derived suggestions as to conduct. It doubtless will be a relief to many who have been oppressed by the idea that the struggle for existence not only settles all questions, but is the true law of life, to find authors who base altruistic ideas upon the constitution of protoplasm. The few, however, who believe that genius is not necessarily a matter of sex, will receive a blow when they learn that "what was decided among the prehistoric protozoa cannot be annulled by act of Parliament." For the sure and true solution of the problems of population and the connected one of competition, "a new ethic of the sexes, . . . an economic of the sexes which will remove the present destructive industrial competition—a reorganization of life, work, and surroundings, is necessary."

Concise historical reviews of leading theories are given, while the summaries and bibliographies at the end of each chapter are valuable aids to the careful reader. An index to the volume insures its utility as a book of reference. The theory is clearly illustrated by several good diagrams, and in general the illustrations are well selected, though in some cases the text would have been made clearer for the general reader by a few more, as when reference is made to lower and more unfamiliar forms of life. As a whole the style is clear and pithy, but the elaborate effort of the first few chapters to use vernacular terms, as "maleness," "very male," "backboneless," meets with its usual antithesis in the later chapters, where the occasional use of a Latin expression, printed in italics, occurs, and "katastates" is introduced to the laity without definition.

The American Race: A Linguistic Classification and Ethnographic Description of the Native Tribes of North and South America. By Daniel G. Brinton, A.M., M.D. New York: N. D. C. Hodges. 1891. 8vo, pp. 392.

This volume is an expansion of one of the lectures published last year under the general title of 'Races and Peop'es.' To understand it properly, we must premise that, in that publication, Dr. Brinton accepts the theory of evolution as being the most satisfactory explanation of man's origin; and in the river drift of France and England he finds proof that the birthplace and original home of the species was in western Europe. This occurred before the great ice age, and at a time when a land bridge connected that continent not only with Africa, but also with Iceland, Greenland, and North America. Over this bridge, to the exclusion of all other methods and lines of travel, the primitive man is supposed to have come; and it was during his long sojourn in the region "east of the Rocky Mountains, and between the receding wall of the continental ice sheet and the Gulf of Mexico," that he underwent the changes that transformed him into the American Indian. From this region, or "area of characterization," as it is called, he gradually spread over the whole continent; and the fact that his migrations were along lines of longitude and not latitude is believed to account, in good part, for the uniformity in physical and psychical traits which seems to have been everywhere preserved. Indeed, so marked is this resemblance that, in spite of certain differences in appearance, culture, and language, we are told that "individuals taken from any part of the continent could be easily mistaken for inhabitants of numerous other parts."

All this is plausible enough, and, aside from the limit as to the routes by which the original immigrant is said to have travelled, there is nothing to which we particularly object. On this point, though, as we have said before, nothing definite is known. The American Indian may have been indigenous, or he may

have come from Asia or Africa, as well as from Europe. We may also add that while the plan of resurrecting a submerged continent in order to bolster up a theory has certain advantages, it is also attended with risk, for the reason that, when once committed to this style of reasoning, there is no telling where we shall have to end. Thus, for example, leaving the lost Atlantis out of consideration, it is as easy to imagine that the Aleutian Islands are part of a sunken continent as that Greenland and Iceland are. In fact, geologists assure us that, possibly, such is the case; and, so far as climate is concerned, there is no reason for supposing that the conditions that prevailed in the two sections were very different. Certainly, if what the botanists tell us of the flora that once existed in the north-polar circle be true, primitive man would have found life there quite as easy as his descendants now do in the country between Hudson's Bay and the Rocky Mountains.

This, however, is but a small matter; and as it is based, chiefly, upon conjecture, and is altogether preliminary, it may be dismissed without impairing in any way the value of our author's classification of the numerous tribes into which the American race is divided. Here Dr. Brinton is at his best. His knowledge of the questions involved is incontestable, and accordingly, when he brushes aside culture and craniology as tests, and declares (p. 57) that language is the only basis upon which the subdivision of the race should proceed, we accept it as an expression of the current scientific opinion of the day upon the subject. But into this field we do not propose to intrude. Unquestionably, this portion of the work, notwithstanding the frequent admissions as to the scantiness of the material, is of the first importance; but, being largely technical, it is "caviare to the general," and, hence, we content ourselves with observing that the author finds eighty stocks, or families of languages, in North America, and about as many in South America; and that among the curious linguistic relationships to which he calls attention is that which existed between the Utes and the Aztecs--tribes which, so far as culture is concerned, occupied the two extremes of the scale.

But while denying that culture, physical conformation, or geographical position can be used as a criterion of race, Dr. Brinton does not hesitate to draw from these sources when describing the appearance and development of the different stocks or families into which the tribes are divided. This he does in a few comprehensive phrases; and although there are a number of statements, or perhaps it might be more correct to say of possible inferences, to which exception can be justly taken, yet, regarded as a whole, his conclusions are so uniformly in accord with those with which the readers of this journal are familiar that we forget the little that is objectionable in this portion of the volume in consideration of the amount of good it contains.

Summing up a few of these conclusions, not so much on account of their novelty as for the purpose of showing the tendency of opinion upon the matters involved, it may be said that above everything else our author insists upon the unity of the race from Greenland to Tierra del Fuego as the bottom fact in American ethnography. Differences there were in many particulars, and some of them were very great, but they were of degree and not of kind. Take, for example, the shape of the skull, and such is the diversity in this respect that (p. 36) "it has frustrated every attempt to classify the existing tribes or trace former lines of migration by grouping together similar head-measurements." The very impossibility of forming any natural division founded upon this feature furnishes an argument in favor of the unity of the race. Cranial comparisons, it is admitted, are of use as marking "distinctive family traits," but beyond this they do not go, as "the shape of the skull is not a fixed element in human anatomy, and children of the same mother may differ in this respect." So, too, in regard to the color of the skin, which varies within certain narrow limits; and the form and color of the hair, which, so far from being uniformly coarse, black, and straight, occasionally "has a reddish tinge," and is sometimes "fine and slightly curly." Although often compared with that of the Mongolians of Eastern Asia, yet it is said "to differ in nearly every particular."

Finally, we are told that the culture of the race was of indigenous growth, and (p. 44) that it was not monopolized by a few tribes, as is generally supposed. Wherever the surroundings favored the development of culture, as in Mexico and Peru, "neighboring tribes, though of different stocks, enjoyed it to nearly an equal degree." Moreover, the difference between the highest and the average culture of the race is much less than has been usually taught. Except in architecture and the possession of one or two inventions which can hardly be considered as marking a distinct stage of civilization, "the Aztecs of Mexico and the Algonquins of the Eastern United States were not far apart." To contrast them, therefore—one as being a savage and the other a civilized people—"is to assume a false point of view and overlook their substantial psychical equality" as demonstrated in other ways.

With such opinions, there is, of course, no room in this volume for idle speculations as to the existence of extinct peoples of superior civilization, who are supposed to have built the mounds of the Mississippi Valley, the cliff-dwellings of Arizona, and the deserted cities of Yucatan. Examined in the cold light of fact, the theories built up with so much labor upon these questions are found to disappear. Ruined cities like Palenque, admitting that they were uninhabited when Cortez passed that way, and were unknown to him, do not differ materially from Uxmal, Chichen Itza, and Peten, all of which were occupied when the Spaniards first visited that region. The cliff-dwellers of Arizona are identified with Uto-Aztecan tribes like the Pimas and others, some of whom were overcome and driven southward within the historic epoch; and as for the mound-builders of the Ohio Valley, we are told, with a moderation that is in striking contrast with the usually positive tone of our author, that "there is a strong probability" that they were the ancestors of the Creeks, Choctaws, and kindred southern tribes. These he groups as "Chahta-Muskokis"—a bit of "pedantry" hard to reconcile with his condemnation of a similar fault in others.

Feudalism: Its Rise, Progress, and Consequences. By J. T. Abdy, LL.D. London: Geo. Bell & Sons. 1890.

It would seem to be impossible for people who write books in English to learn that any investigations of early feudalism have been made within the last forty years. Even Hannis Taylor, in his 'Origin and Growth of the English Constitution,' following Freeman, who follows Palgrave, makes the beneficiary system originate in "grants of land-benefices or fiefs" made by the Teutonic kings to their followers—a practice suggested to them by the Roman custom of granting lands upon a military tenure to colonies of soldiers on the frontiers. He refers to Waitz as authority for this statement, but this is exactly what Waitz says did not take place.

The volume before us would hardly deserve the space of this notice did not its title promise to supply a painfully felt want in our historical literature. But the promise of the title is left sadly unfulfilled by the book itself. It is confused and even self-contradictory, frequently inaccurate, and follows avowedly as its chief authority Guizot, though the later English authorities are frequently referred to. Guizot's writings will probably be worth reading so long as history is read at all, for their suggestive and stimulating presentation of the general unfolding of history; but as authorities for any detailed knowledge of the facts of mediæval institutions they are about as valuable as if they had been written in the days of Moses.

The part of this book which treats of the origin of the feudal system is but little more, as the author himself says, than a translation of the 'Essais' of Guizot. The fifth lecture, which has an extremely important subject—the origin of the benefice—is based upon Guizot's fourth essay, but is far less clear than the original, and can hardly give a definite idea of that process to any one. It starts out as if the benefice had its origin in the *comitatus*, but the idea is not developed clearly. It then discusses the length of time for which benefices could be held—an entirely subordinate and unimportant point in the real history of feudal beginnings; speaks of the Church lands and the Church *precariæ*, but with no indication of their relation to the origin of the beneficial tenure; alludes in passing to the secularization under the early Carolingians, but tells us nothing of the great controversy on this point nor of its importance; describes commendation, but does not state its origin nor appreciate its part in the growth of feudalism; speaks of tributary lands—meaning evidently land paying a *cens*, but appears to include under it Roman land made tributary to the newly established German State; mentions the commendation described by Salvian, but gives no hint of its connection with that which has been described before; and would lead us to infer that all benefices were held by military tenure from the beginning. Guizot's study of which this is a summary was an earnest one in the days when men were groping among these scattered facts for their lines of connection, and were still unable to indicate how each made its contribution to the common result—the feudal system; but why should such things be reproduced in English at this late day?

Instances of carelessness and even inaccuracy abound: a writer of the tenth century is put into the fifth; John Scotus Erigena is made the friend of Charlemagne; the oath of allegiance exacted by William of all the Saxons makes them the King's vassals and changes all tenures into feudal ones. But it is not worth while to multiply instances. The larger part of the book is devoted to Saxon institutions and those of the Norman conquest. Here the author has at his hand better and more recent authorities, though he does not follow them exclusively, and there are far too many evidences in this part of his work also of carelessness and incomplete knowledge.

There is a very rich field waiting to reward some investigator who shall examine the documents illustrating the semi-feudalism which grew up in England before the Norman conquest, and compare them in minute detail with the corresponding Continental documents of

the real feudal system in its formative stages. This is especially true with regard to the still only half-understood subject of the immunity and its relation to the growth of private jurisdiction. But such work, when it is done, will be very different from that before us.

La France. Par Angelo de Gubernatis. Florence: J. Civelli.

UNDER this title Count de Gubernatis has collected impressions and notes inspired by his warm attachment to France, and—delicate attention—he has written them out in the language spoken on the banks of the Seine. To say that the work breathes sympathy would be to express coldly the tone of it. Italian enthusiasm, when complimentary, is prodigal, and the amiabilities intended by the writer to prove to France how high she still stands in the admiration of the world are enough to disconcert the most self-satisfied Chauvinism. We doubt if there are many Frenchmen who would offer, in the name of patriotism, such unalloyed praise to their country as is done by this Italian writer. France is proclaimed the image of civilization. Each nation may have superior special qualities, but no population presents an ensemble more varied, more rich, more harmonious. With subtle deftness the writer gives the explanation of this enviable entity, showing the many foreign threads with which France has woven the tissue of perfect civilization. Spain, Italy, England, Holland, Germany, Russia, and America have furnished her with precious teachings, and, in her constant work of international assimilation, France, discarding the uncouth or the excessive, has embodied all the contributed elements in her organism. The eulogist, however, is not without his cordial censure. France is a great country, but let the French of 1890 take care. National politeness is on the wane; on the decline, also, the charm which came from the confiding bonhomie so characteristic of the French. The cosmopolitan spectator is forced to declare, with apologies for taking such a liberty, that priggishness is noticeable in the citizens, one and all, of the Third Republic, from the humblest to the President, who "salutes the crowd with Sultan-like bows that went out of fashion a century ago in foreign courts."

But De Gubernatis's work has another object than to deal with the French as a people, viz.: to bring about a permanent alliance between France and Italy. He contends that contemporary France does not sufficiently understand her real interests in Italy.

"So long as Papal Rome represented for France the tradition of the old Latin civilization," says the writer, "seeking a *point d'appui* in Rome was plausible; in the eyes of Charlemagne, Rome was perhaps the highest expression of civilization. But since the rise of the great communes and the Italian renaissance, Papal power has ceased to personify Italy. Each time France interfered to uphold the cause of the Pope against the new interests of the Italian people, she made herself unpopular. . . . To-day part of France still prefers to uphold the dead rather than the living, and to this traditional error in French politics, which delayed in the past the political resurrection of Italy, may be ascribed the misunderstandings now preventing France and Italy from joining in a march towards one purpose."

The writer expresses a desire that an international history of France and Italy should be written. The time has come for the historian to look behind the princes, causes of past wars, to the people who bore the brunt. Homage may be rendered to patriotic sentiment without precluding an equitable appreciation of the enemy of a day. Such a history would render a war hateful between two nations who have so much in common. Italy has borrowed much from France. In her administrative, judicial, financial, military, and scholastic administration it is the French mode that prevails. Geographically, too, the countries have links. Provence is the intermediary. If there were no political frontiers between Provence and Italy, the transition from one to the other would scarcely be perceptible. "The Italians of Florence speak as well as the Parisian [better, we should say] the Provencal tongue with its numerous dialects that have given such poetical opportunities to the Félibres." Yet M. de Gubernatis does not hesitate to decide the question of Nice French or Nice Italian. Sentiment apart, and considering only the interests of the people, he acknowledges that Nice is more at home than it would be under Italian influence. This acknowledgment is followed by the remark that if Nice has resisted five centuries of loyalty to the house of Savoy to become French, a single century of French dominion in Alsace does not prevent Germany from claiming that province as hers. He continues:

"The unity of Italy and that of Germany, to which France contributed, intentionally or not, have turned against her. The fact is to be regretted, but not because what is a boon for Germany and Italy is an evil for France, but because France has not had the good sense to embrace these two resurrected nations as soon as they rose up. Neither Italian unity nor German unity was a cause of alarm to France."

Had she behaved quietly towards her two neighbors, the author thinks that she would have attracted to herself all their sympathies and all sorts of benefits.

Treating of Colonial France, De Gubernatis offers parallel advice to France and Italy. More is gained by being in accord with neighboring nations than by constant discord, and it is better to refrain from future conquests and administer more wisely what is in hand. He is of opinion that Italy would be the best colony for Italy. Cleared, cultivated, and enlightened, it might be a promised land better than the Eldorados her immigrants seek elsewhere; but since colonization has opened to Italy a new field in Africa, he asks for encouragement so that she may link Europe with Sudan through Massowah.

A good third of the volume is devoted to Paris, in order to prove that the capital of France is not falling into decadence. This essay appears foreign to the object of the book—perhaps from the way it is presented. As an example, the writer, who is supposed to view the Paris of to-day, wanders into reminiscences of the salons of Mme. Mohl and Mme. d'Agoult—interesting reminiscences, no doubt, but likely to be voted superfluous by the reader seduced by De Gubernatis's theory that an alliance between France and Italy would lead to his ideal triple alliance, which, in addition to the two aforesaid countries, would include Germany. They could well have been spared to make room for a better appreciation of the evolutions taking place in Paris life.

Impressions and Opinions. By George Moore. London: David Nutt. 1891.

SIX essays upon books and authors, six upon the drama, and four upon art make the contents of this provocative volume. Mr. Moore works a vein of his own in criticism; he holds opinions of an uncompromisingly modern cast, and he applies them practically without much respect to persons or traditions. He writes like one who makes enemies easily and without any regret; he seems to have a fancy for a pretty quarrel, and he is much more interesting in his remarks upon the contemporary theatre and upon art than in those upon literature, where his pugnacity has less play. The literary criticism is, in fact, commonplace, except when it is erratic; it is no more than a succession of short book-reviews strung into an article on Balzac or Turgeneff, keeping close to the characters and growing wearisome with detail; and mainly it is craft-criticism—what one novelist has to say of the work of another. At the end of the paper on Balzac Mr. Moore expresses himself by saying, "As I understand criticism more as the story of the critic's soul than as an exact science, I confess that I would willingly give up 'Hamlet,' 'Macbeth,' 'Romeo and Juliet,' etc., for the yellow books." Perhaps if he had put more of the "story of his soul" into the paper, he would have illustrated this theory in a way which would have permitted some examination of it; but as he has already published his 'Confessions,' he may have thought the repetition of them in the critical form unnecessary. Meanwhile all we really learn is that personally he prefers Balzac to Shakspere, which is not a matter of great consequence.

An erratic critic, however, sometimes does a service by directing attention to little-known authors whom he has undertaken to patronize. Being an oddity himself, he has an affinity for oddities, in accordance with the gregariousness of cranks; and in literature a habit of eccentricity in one's self goes far towards the appreciation of eccentric writers. Mr. Moore takes pride in having been the first to introduce the French poet, Verlaine, to English readers—he indulges in much self-esteem on this account; and he returns to the modern Villon in this volume with effusion. He says plainly enough that Verlaine is a very malodorous person; he describes him as a kind of human beast, and the account of the single interview he had with the prodigy is nauseating. Here he couples him with Rimbaud, the young poet whom Verlaine, being his intimate friend, stabbed, and so was sent to jail for a while. They were both bad enough, but Rimbaud was converted, and, after a fruitless effort to draw Verlaine from his sins, immured himself in a convent on the shores of the Red Sea, where he is said still to be digging the soil in pursuit of grace. Verlaine remained the scamp he had always been, and continued to write verses, many of them of a religious sort. Mr. Moore says that the poems of this precious pair are great. We cannot better exhibit his attitude than by the following extract:

"Verlaine knows English very well, and he deeply regretted that he had not the necessary money to take him straight to Lord Tennyson, so that he might obtain permission to publish a volume of translations. I went to the Macmillans and asked them if the matter could be arranged, but I heard no more of it. Lord Tennyson has, therefore, missed being translated by one who in a sense is greater than he."

Could anything be more delightful, in the unfailing comedy of the hobby-horse, than this?

We let Mr. Moore's literary criticism go; but in dealing with the theatre, and more particularly with art, he is as original without being quite so antic in his disposition. The condition of the English theatre from the point of view of the literary play-writer is held up to scorn, playfully but vexatiously enough to the authors and actors. The amateurishness and materialism of the stage are dwelt on, and the secret of the literary paralysis of the

drama is said to be the "three-hundred-night run," in the main. But Mr. Moore is not content with smiting the present actors, hip and thigh, upon the boards; he has a word to say of their "reminiscences," and, not to delay with their fertility in such "literary" works, he has more than a word to say about their entrance into society. The conclusion of his remarks is after this fashion:

"To-day the stage is as moral as it was a hundred years ago—as much so and not one jot more. The alliance between Church and stage is a subject wherewith the hypercritical may trade on the eternal credulity of mankind; the alliance between the stage and society is unfortunately a reality, and I have attempted to explain its genesis. The dramatic profession has been, is, and always must be a profession for those to whom social restraints are irksome and who would lead the life their instinct dictates. The ideal mother cannot be the great artist. The ancients knew this well, and did not waste time in striving to unite the cradle and the *chef d'œuvre*. And since, in the eternal wisdom of things, we must find a place for vice as well as for virtue, for the Bohemian as well as the housewife, I believe that little will be gained by emptying the *coulisse* into the drawing-room and the drawing-room into the *coulisse*.

But perhaps the most important part of this theatrical criticism is that which describes the Théâtre Libre, and calls for the establishment of a similar institution in London (now partly realized) as the best means of encouraging new play-writers of original ideas and some literary pretension.

The essays upon art deal with the quarrel between the *Salon Julian* and Meissonier, with which our readers are sufficiently familiar, and with "Art for the Villa," Degas, and the pictures recently acquired at high prices by the National Gallery. The last subject may be dismissed with the remark that Mr. Moore does not approve of the purchases in general. Degas is very handsomely treated. Like Verlaine, he is one of Mr. Moore's fads. The essay is really interesting, and is successful in giving a vivid impression of the artist and his work. There is some side-thrusting at Whistler, too, not too inimical for pleasure in the on-looker. According to Mr. Moore, Degas is so much sharper in repartee and phrasing than Whistler is that the latter is distinguished, when the two meet, for "flashes of silence." There is nothing better among the anecdotes than this passage, which brings the two together with Manet:

"He [Manet] would say, 'You, Degas, you are above the level of the sea, but for my part, if I get into an omnibus and some one doesn't say, "M. Manet, how are you? Where are you going?" I am disappointed, for I know then that I am not famous.' Manet's vanity, which a strange boyishness of disposition rendered attractive and engaging, is clearly one of Degas's happiest memories; but all the meanness of *la vie de parade*, so persistently sought by Mr. Whistler, is bitterly displeasing to him. Speaking to Mr. Whistler, he said: 'My dear friend, you conduct yourself in life just as if you had no talent at all.'"

This mention of Manet reminds us to add that the glimpse of him given in connection with the Vandyke purchased by the National Gallery is the most pleasing and simple passage in the book. Mr. Moore spent two years in his studio, and in speaking of his old master for once he forgets himself. The remaining artistic essay, "Art for the Villa," is suggestive and well worked out. He starts from the opinion that the villa is the feature of this age, as the palace and the cathedral were of the last few centuries; and he then insists that it is folly to adorn the villa with statuary and oil paintings, which belonged to the older architectural ground of art. Let us have etchings, drawings, bronzes, and in general the *bibelot*, in place of the older and grander things, and not try to live with the "Mona Lisa" and the "Ariadne" always before our eyes. Would we wish, he asks, "a perpetual performance of 'Hamlet' or 'Tristan und Isolde'?" Then he goes on to speak of Whistler and the artisan-artist, and the sense of the value of material for its own sake as well as for its ornamental form, and the remainder, as was to be expected, with the same extravagance and all too easy cleverness that impair the seriousness of his whole book, but with a certain amount of the common sense that serves him except when he writes "the story of his soul." This last group of essays gives a stronger impression than the earlier ones that the author's eccentricities may not swallow him up.

Sir Robert Peel. By Justin McCarthy, M.P. Harper & Brothers.

Peel. By J. R. Thursfield. London and New York: Macmillan & Co.

THE first of these volumes is one of the biographies of the Prime Ministers of Queen Victoria edited by Mr. Reid. The life of Sir Robert Peel ought certainly to have been one of the most interesting of the series, and it is therefore to be regretted that Mr. McCarthy has done scant justice to his subject. He has, indeed, shown how important an influence Peel exercised over the minds of his colleagues and over the course of political affairs, but he fails to appreciate the reason of that influence. He speaks slightingly of Peel's scholarship; and though he quotes Byron's remark that when they were boys together at Harrow every one predicted a great future for Peel, he makes no mention of the fact that Peel was the first who ever obtained what is called at Oxford a *double-first*, that is, a first-class in both classics and mathematics. It was this excellent training of a naturally versatile intellect which enabled him to master the most complex questions, and by superior knowledge to impose his views upon men of decided character, like the Duke of Wellington. He was not a man who formed his opinions rapidly. On the contrary, his final judgment on two of the most important measures with which his name is inseparably connected, namely, Catholic Emancipation and the abolition of the Corn Laws, was arrived at after some years of discussion and investigation. But his colleagues, even when they hesitated to follow his lead, were compelled to admit that his knowledge of the question at issue was infinitely better than theirs; and, having once taken his stand, he had the courage to face all the pains and penalties attaching to changes of political opinion in the effort to carry out what he believed to be the true policy.

The resemblance between Peel and Gladstone has often been pointed out; and it is a curious fact that in 1829, soon after Peel had carried Catholic Emancipation, Gladstone, then an undergraduate and a high Tory, moved in the Oxford Union a vote of censure against the Minister. Not many years afterwards, however, he was working out the problems of free trade under this same Minister; and undoubtedly the elder statesman had something to do with moulding the opinions of the younger. Both were excellent classical scholars, and posterity will probably decide that both have excelled in financial and fiscal legislation. Unfortunately, Mr. McCarthy does not give much attention to these matters. He does, indeed, refer to Peel's chairmanship of the Committee on the Resumption of Specie Payments in 1819, when he delivered himself of the sound doctrine that "the true standard of value consists in a definite quantity of gold bullion"; but he does not even mention the Bank Charter Act of 1844, generally known as Peel's Act. In the light of subsequent events, opinions may differ as to the wisdom of that Act, but it was certainly one of the most important measures of the day, and no biography of Peel can be considered adequate which passes it over in silence.

Aside from these graver faults, the reader will observe in this volume some minor defects which seem to indicate haste and carelessness. Dates, for instance, are used with the utmost economy, and the reader is left to judge of the duration of ministries and many other matters by the light of knowledge acquired elsewhere. Even Peel is spoken of as *Sir Robert* twenty years before he succeeded to the baronetcy on the death of his father.

It is unfortunate for Mr. McCarthy that Mr. Thursfield's 'Peel' should have appeared at this time, as a comparison between the two biographies is inevitable, and the verdict must certainly be in favor of the latter. It is superior to Mr. McCarthy's work in every point, and it is specially explicit and satisfactory in regard to the particular matters which he has neglected. Thus, Mr. Thursfield gives an interesting account of Peel's free-trade budgets of 1842 and 1845, which made possible the enormous expansion of English manufactures in the following thirty years; and he very truly says of the great speech in which Peel introduced the Bank Charter Act of 1844, that it remains to this day the most authoritative exposition of the principles of the British currency system. According to Mr. Thursfield, Peel's most important defect was that, while he had a clear insight into the condition of affairs at the moment, he lacked political foresight. He possessed, however, the faculty of taking infinite pains—which, if not genius, is an excellent substitute for it—and his views were favorably modified by the logic of facts, which he took infinite pains to collect and investigate.

Primitive Folk: Studies in Comparative Ethnology. By Élie Reclus. Scribner & Welford. 1891. 8vo, pp. xvi, 339.

IT has been the habit of returning travellers to relate marvellous tales. In earlier times society might well consider itself defrauded should a traveller bring back from foreign lands no story of terrible or extraordinary animals or natural phenomena; no relation of barbarous, filthy, or abnormally singular practices on the part of the inhabitants. To be thrilled by travellers' tales afforded a pleasant and innocent excitement to the blasé townsman and unsophisticated villager alike. It cannot be said that travellers have ever proved unresponsive to these demands. No traveller is known to have existed so poor in experience (or imagination) as not to have provided some aliment for this appetite, some story, if not true, at least *ben trovato*.

Naturally, the ways and manners of savages afforded abundance of unexpected and surprising items for such chronicles. Misinterpreted and misunderstood in almost every instance, the ethics of the barbarian, sufficiently peculiar in themselves, became incoherent and chaotic. Stories told at second hand by credulous or too imaginative travellers often proved more "juicy" than such as were the fruit of direct observation. All these things, tinged with the mental coloring of the narrator and modified to suit the prevalent literary taste,

the public appetite for horrors, or the pious zeal of sectarians, were often preserved for posterity in print. Now in these latter days comes the closet ethnologist or historian of native races. He desires to make a book which shall interest and instruct, and, above all, shall sell. With tireless industry he delves in old books of travel for interesting and instructive tidbits. Naturally, the result is a mosaic of cock-and-bull stories, which are always interesting and seldom true, set in a framework of more or less uninteresting fact.

To illustrate the process, a case may be cited. In a recent work of great erudition and untiring scissor-work, it was deliberately stated that a favorite dish of the inhabitants of the Island of Kodiak was composed of bear's dung. As this seemed somewhat improbable, and as the reviewer happened to know that the only objurgation or analogue of a curse afforded by the language of these people is the imperative "May you eat dung," he set himself to discover the source of this libel upon an unoffending tribe of Innuit. After tracking the story a little way, it appeared that it was deer and not bear that was the original animal referred to; and, to be brief, that the whole resolved itself into the well-known habit of northern tribes of using as a sort of salad the dry, clean buds which the reindeer accumulates in his anterior paunch, to the amount of a peck or so, before they are regurgitated and masticated in chewing the cud. Any one who has ever handled this material knows that there is nothing unclean or offensive about it, any more than in the case of honey. Yet the "bear's dung" reappears in the present volume, and is likely to appear in similar compilations as long as a public demand for such anecdotes is believed to exist.

The author of the book under review is one of that prolific family of which the geographer, Élisée Reclus, is the most distinguished member. If we mistake not, the French original was published some years ago. The translation is fairly good, if it does give us "marine mares" for "sea-horses" in one place. There is a great accumulation of facts in the book, set forth with a good deal of literary dexterity. Among these facts are many errors, some egregious blunders, and countless misconceptions. The chapters are of unequal value; those derived from comparatively few and modern sources, like that on the Todas, are the more accurate, those from more ancient the reverse.

As a whole, it seems to us that the pictures of primitive people which are gathered in this volume are distorted, sensational, and often grossly unjust, while the bias of the author is distinctively and aggressively antichristian. There is also a pruriency in the dwelling on certain aspects of savage life which, in our opinion, renders the book undesirable reading for the young, as well as more or less unacceptable to adult readers of taste. But, even if we waive all literary criticism, it is obvious, in the light of modern research, that a book of this class cannot fail to be more or less misleading in direct proportion to its inclusiveness, and this without calling in question the honesty or faithfulness of the compiler. No one without personal experience of the daily life of savage people, as well as high qualifications in comparative ethnology, is fitted to generalize on the life of even a single tribe, much less to pass judgment on the probable truth of hasty observations, generally made by unscientific travellers, indiscriminately assembled from the literature of a century and a half.

Gypsy Sorcery and Fortune-Telling. Illustrated by Numerous Incantations, Specimens of Medical Magic, Anecdotes, and Tales. By Charles Godfrey Leland. Copiously illustrated by the Author. Charles Scribner's Sons. 1891.

THIS handsome volume professes to have sought for the element of truth in gypsy sorcery and superstition in "a rational and philosophic spirit," and also to present illustrations of the author's remarks "in a manner which will prove attractive to the general reader." The last may be conceded more easily than the first. Mr. Leland's idea of scientific and historical proof is decidedly deficient, and his incoherent and self-contradictory style is enough to bring a more correct idea to grief. As a collector of curious bits of information within the lines of what he has made his specialty, he finds better success. Everything is fish that comes to his net, and one authority is as good as another for him; moreover, he is constantly breaking through his own classifications. Yet his work betrays great industry and wide reading, and must be regarded as a considerable addition to the literature of his subject. The "copious illustrations," it ought to be said, consist almost solely of tail-pieces and initial letters.

BOOKS OF THE WEEK.

Atkinson, Rev. J. C. Forty Years in a Moorland Parish: Reminiscences and Researches in Danby in Cleveland. Macmillan & Co. $3.25.

Back Numbers of "The Nation."

In response to frequent inquiries from subscribers:

An incomplete set of THE NATION has little or no market value. Partial sets, bound and unbound, are always obtainable (usually lacking the earliest volumes), and do not command high rates. The bindings generally count for nothing, owing to great diversity of styles. Volume I. has readily brought $10 and upward when complete, bound or unbound, but will bring very little in proportion if a single number is missing. Volumes II. and III. are also scarce, but not so high-priced as the first

Complete sets, both bound and unbound, have sold for $100, with tolerably quick bidders, and have an increasing value year by year.

Single numbers not more than a year old can usually be supplied by the publishers at 10 cents each. For numbers more than a year old purchasers are referred to Mr. J. W. Christopher, 47 Dey St., New York; Mr. A. S. Clark, 34 Park Row, or H. Williams, 195 West Tenth Street.

The publishers no longer undertake to buy or sell numbers or volumes more than a year old, and can only recommend sellers or purchasers to negotiate with a dealer, or to advertise in THE NATION.

[Publication was begun July 1, 1865, Vol. I. comprising the last half-year. Two volumes per year have since been issued, Vol. LI. comprising the last half-year of 1890.]

The Nation.

NEW YORK, THURSDAY, MAY 21, 1891.

The Week.

EVER since 1884 we have been inclined to suspect all Republican quotations which in any way helped the cause. That is to say, we have always been inclined to believe that they were either sheer forgeries, or that they came from some other source than the one to which they were ascribed, or that they had been modified in some such way as to alter the sense. We could produce conspicuous illustrations of all these offences. Accordingly, when we found this in the *Tribune* of Monday, coming from Secretary Tracy, we took the precaution to go to the original report:

"The Navy Department has fortified itself with legal authority for the present pursuit, and finds ample defence for the seizure upon the open seas in the decisions of the Supreme Court. A hundred years ago that tribunal decided (Rose vs. Henley) that 'the seizure of a ship upon the high seas after she has committed an act of forfeiture within the territory, is not inconsistent with the sovereign rights of the nation to which it belongs. Whatever the great principle of self-defence, in its reasonable and necessary exercise, will sanction in the individual, in a state of nature, nations may lawfully perform upon the high seas. And again (Hudson vs. Genster): 'The laws of the United States upon the subject appear to have been framed after a model of the English statutes, and the act of 1799 expressly authorizes the seizure of a vessel that has, within the jurisdiction of the United States, committed an act of forfeiture, wherever she may be met with by a revenue cutter, without limiting the distance from the coast.' This principle was again recognized in the Supreme Court in the case of the *Mariana Flora*, where Mr. Justice Story says: 'It is true that it has been held in the courts of this country that American ships offending against our laws, and foreign ships in like manner offending within our jurisdiction, may afterwards be pursued and seized upon the open seas and rightfully brought back into our ports for adjudication.'"

What we found, in the case of Rose vs. Himely (not Henley) was, that the court, through Chief-Justice Marshall, decided *exactly the other way*, and that the dictum here quoted came from the *dissenting opinion of Justice Johnson*. Moreover, the case was not in point for the purpose of the present discussion. The question was whether "a French Admiralty Court which had condemned an American ship" had "competent jurisdiction," and whether the Supreme Court "could examine the jurisdiction of a foreign tribunal." Both the other cases cited are cases of merchant vessels. The *Mariana Flora* was a Portuguese mercantile ship captured and brought in by a United States cruiser for firing on her under a mistaken notion of her character. It was apropos of her that Justice Story made the statement quoted, which nobody has ever questioned, but his qualifying sentence has been left out: "This, however, has never been supposed to draw after it the right of visitation or search. The party in such cases seizes at his peril. If he establishes a forfeiture, he is justified. If he fails, he must make full compensation in damages." This everybody has always known. The *Charleston* might, at her peril, seize a mail steamer on the high seas, but whether she could legally seize the man-of-war of a belligerent is another matter.

President Harrison is back in Washington from a long and successful tour of the country. He seems to have had a good time, and the trip ought to be of service to him in more ways than as affording a change of scene. He has made a great many speeches, and they have been as a rule very creditable, while he has not "slopped over" anywhere. There has been considerable speculation as to the effect of the tour upon Mr. Harrison's personal fortunes. No reason appears for attaching any special importance to it in this respect. He returns the same sort of figure in his party that he started—its nominal head, but without the slightest hold upon its affection or enthusiasm. It still remains as necessary as before for his son to explain through his newspaper that the father is really a great man; and the prospect of being obliged, by force of circumstances, to support him for a second term is no more attractive to Republicans generally than it was a month ago.

Now that China has refused to receive Mr. Blair as our Minister, it comes out that the present Minister, Mr. Denby, has filled the post so well that all who were familiar with the facts had sought to secure his retention. A missionary of the American Board in North China for years, now in this country, says that the American missionaries of all denominations are heartily in favor of Mr. Denby's retention, and had petitioned President Harrison to that effect. It appears that, upon arriving in China, Mr. Denby decided that it was an important part of his duty to look after the missionaries, and that their interests as residents in a foreign country have never before received such careful attention. He has been equally conscientious in regard to his other duties, and this missionary declares that "no new minister could do better than Mr. Denby has done for American interests in China." In view of these facts, two or three Republican newspapers are urging President Harrison to retain Mr. Denby, in spite of the fact that he is a Democrat. The Springfield (Mass.) *Union* thinks that "President Harrison might do worse than to allow him to remain," while the Norwich (Conn.) *Bulletin* admits that "between such a representative and Mr. Blair a good many people would prefer Mr. Denby," and thinks that "perhaps President Harrison will come to the same state of feeling." We must warn the *Union* and the *Bulletin* that they are getting upon dangerous Mugwump ground. The Mugwumps hold that fidelity and efficiency should be the only sure tenure of office, and that a man who has shown himself conspicuously faithful and efficient—whether as Minister to China or as Postmaster of Boston—should be retained. But it will be remembered that when the question of reappointing such a postmaster was pending last March, Mr. Harrison decided against it for this reason:

"The President thought that, considering the attitude of the Democratic party, which was murdering United States marshals and expelling Republican postmasters from their offices in the South, and endeavoring to overthrow constitutional government by revolutionary proceeding both in the House and Senate, and by preventing honest elections wherever they could get the power so to do, it was not wise to appoint to an important office a person who made no expression anywhere of disapprobation of these things, and whose political influence, so far as it was exerted, was in their favor."

We can see no reason why this argument does not apply to Mr. Denby as well as to Gen. Corse. He has had ample time to express himself on these questions, but not one word of disapprobation has he uttered. All the talk about the missionaries in Mr. Denby's case, like that about efficiency in Gen. Corse's case, is really *aliunde*. The only question is, To which party does he belong?

The most creditable feature of Mr. Harrison's Administration has been the President's judicial appointments, which, as a rule, have been excellent. Apparently he intends to maintain the high standard which he has hitherto reached during the remainder of his term. No sooner had he returned to Washington than "pressure" was brought to bear upon him for the immediate appointment of the nine judges who are to constitute the new appellate court which was created at the last session of Congress, but he announced on Monday his determination not to make the appointments until the names of those selected could be sent to the Senate for confirmation. This is the only reasonable and proper course to pursue. Whether or not the letter of the Constitution would permit the President to make such appointments while the Senate is not in session, the spirit of that instrument is clearly opposed to the placing upon the bench, by the President, of a judge who may be forced to surrender his seat a few months later because the Senate refuses its "advice and consent" to his appointment.

A fresh scandal about the Pension Bureau must have imparted a familiar odor to the official atmosphere of Washington as the President sniffed it on his return on Friday. He at least ought not to have been surprised to hear that the son of his Commissioner of Pensions had been forced to resign for selling appointments in the Bureau and appropriating to his own uses petty sums of the Bureau's money. The son has evidently been imitating his father's methods, and doing so with the belief that they were safe ones for him to practise, since the President had kept

his father in office in the face of all evidence that he was using his position for unworthy ends and personal pecuniary profit. If the father did not know what the son was doing, the fact that the son could do what he did without instant detection is a fresh proof of the lax and irresponsible system upon which the Bureau's affairs are conducted.

Delaware falls in line as the twenty-fifth State to pass a ballot-reform law. The measure is an entirely satisfactory one, being a thorough adaptation of the Australian system. It provides for a blanket ballot, prohibits the use of pasters, and forbids the use of any except official ballots, which can be obtained only in the polling-places. The compartment or booth system of voting is to be followed, so that a really secret, exclusively official ballot has been obtained. The Delaware law-makers have not been influenced, as those of New Jersey and Connecticut were, by Gov. Hill's pernicious assaults upon the Australian system, although an effort in that direction was made. Their law is, in fact, as good a ballot law as any other State has secured. There are only three separate-ballot laws, those of New York, New Jersey, and Connecticut; all the other twenty-two States having adopted the blanket ballot.

Ex-Congressman Butterworth does not take a rosy view of the prospects for electing Mr. McKinley Governor of Ohio. "From what I hear," he is credited with saying, "I suppose McKinley will be given the nomination by our people—the Republicans—for Governor. The issue will be the old tariff question. Whether it is wise to make a State campaign on such a national issue, I will not say. It seems that it will be done, however. You must remember that nominating conventions do not make issues—issues create themselves. But this I will say—no high-tariff issue will ever succeed in this country, as the lesson of last fall taught us. I would never be in favor of it, and yet I have always been a strong advocate of the protective idea. The high-tariff idea can never carry, and it would be as calamitous as pestilence if it did." This is the opinion of a man who, though he opposed some of the provisions of the McKinley Bill, voted for it on its final passage. It would be depressing kind of talk to have making itself heard in Ohio during a McKinley anti-cheapness campaign, but there are evidences that, if Mr. McKinley is nominated, Mr. Butterworth will not be the only Ohio Republican who will indulge in such talk.

The McKinley Administrative Law is working precisely as every competent student of its indefensible provisions foresaw it would. The *Dry Goods Economist* says that "denunciation and disapproval continue to pour in from all quarters for the act and its effects," that it seems "impossible to find a champion for the system it has established either among importers, lawyers, or judges," and that the only persons "who advocate its continuance in an unchanged form are a few of the 'Knownothing' merchants, who openly avow their desire to prevent importations and their approval of whatever tends to that result." That was the kind of merchant for whom the law was designed, and whose interests it was supposed to benefit. Concerning the ulterior motives of the originators of the measure, the *Economist* says:

> "As the Supreme Court has recently refused to give priority to this class of cases, an importer who wins before the Board and before the Circuit Court has now the cold comfort of waiting three or four years to see whether the Supreme Court will sustain the decision in his favor. And the matter of most unpleasant significance in all this is, that those who rejoice in the barrenness of results from the contentions of importers, profess to know that the intentions of the law's framers are thus being carried out. In other words, it is seriously maintained by many that McKinley's Committee devised a scheme, under the pretence of reform, to do away with all contests as to rate, and make the Collector's decision absolute and final."

Our readers will not be surprised at this view of the intent of the law. It was inspired by that kind of "genuine Americans" who look upon importing as a criminal business which should be prevented by any means, legal or illegal, and upon importers as a class of anti-Americans who should be driven out of the country or into bankruptcy for their diabolical efforts to sell the American people such foreign products as they are unpatriotic enough to wish to buy.

A St. Louis correspondent of the *Times* has investigated the celebrated "Tin-Plate Works" of that eminent Republican manufacturer, Mr. Niedringhaus, and has discovered that they consist of a shed fifty feet long, fifteen feet wide, and ten feet high. This immense edifice, of rude and hasty construction, is divided into three rooms. The first of these is obviously the Preparatory Room. In it the reporter discovered several small piles of sheet iron, of tin-plate size, upon which a "force," consisting of one young man and a boy, were operating. The boy had handed a plate to the man, and the man was rubbing it with a rag. Whether both man and boy were genuine Americans, the reporter was too dazed to inquire. Passing to the next room, which was obviously an annex to the Preparatory Room, a second "force," consisting of three men and two boys, was discovered, doing nothing in particular except to pass on towards the third room the plates which had been through the rag-rubbing process. Whether this "force" was genuine American or not, the reporter also failed to ascertain. In the third, or "Dipping Room," the reporter came at once upon the very citadel of the works. In a space three feet by five, he was shown the entire plant, consisting of three pots, set in a brick-like furnace, and containing liquid tin boiling away like fury. Two full-grown men composed the "force" in this room, both hard at work, one dipping a plate in one of the pots and the other looking on to see what came of it. The dipper spoke with a strong English accent, and confessed without shame that he was from Swansea, Wales, where he had learned the tin business. He showed his anti-American bias by saying that the work which the "force" in the Preparatory Room was doing was "gals' work in the old country." None of the tin plate thus turned out is for sale, Mr. Niedringhaus simply manufacturing it for distribution at Republican conventions and among Republican newspapers.

The Kentucky Democrats have adopted a platform which is strong and sound on the tariff and the McKinley Bill, but they have weakened the effect of it by a free-coinage declaration which reads as if it had been borrowed from the Farmers' Alliance. Mr. Blaine will be interested to see that they have borrowed, without due credit, his famous denunciation of the McKinley Bill as a measure which "does not open a market for a single bushel of wheat or a single barrel of pork."

A few weeks ago Neal Dow induced the Maine Legislature to amend the Prohibitory Law in such manner as he declared would put an end to the liquor traffic. The new statute went into effect on the 1st of May. The Lewiston *Journal*, a Republican newspaper which believes in prohibition and always tries to make out the best possible case for that policy, in its issue for the 12th of May, says that "a correspondent from Belfast writes in a disheartened strain in regard to the liquor business there. Rum-selling will run riot there this summer, the rumsellers having taken new courage from the results of the late session of the S. J. Court, where all the cases but one were either nol-prossed or found not guilty. Another new rum-shop opened on lower Main Street, Saturday, when court adjourned, and now there are more than twenty places where intoxicating liquors are sold without let or hindrance." Belfast is a place of less than 6,000 inhabitants, and "more than twenty" rum-shops in a town of that size means about the same ratio to population as in New York city.

The history of the modern literary use of the word "mugwump" is enlarged by a recent contribution to the *Vermont Standard* from Mr. Henry S. Dana of Woodstock, Vt. Mr. Dana is deeply versed in neighborhood matters, and has written an elaborate history of Woodstock. He says that the *American Whig* newspaper, published for several years in that town, contained the following, under date of August 24, 1832:

"DYING CALL," OR THE CAT LET OUT OF THE BAG.

☞ Through the politeness of an anti-Masonic friend in a distant town we have been furnished with a copy of the *secret bulletin* of the Clay Masonic party. It has extensively circulated among the Knights of Kadosh and the Most Worshipful Mugwumps of the Cabletow nearly a month ago, and with so much "secrecy and caution" that we have been unable to get sight of a copy until the present moment.

Mr. Dana says: "The credit of starting the word 'Mugwumps' in the public print must be given to our fellow-townsman Henry S. Hutchinson, until some person appears who can establish a prior claim." It may be doubted whether at this distance of time a claim prior to 1832 can well be established by production of a printed record; but ever since the days of the Pilgrim Fathers the word has been familiar in New England communities. Because it was thus familiar, the Vermont editor sixty years ago used it in addressing the plain people of his constituency. He knew that they would understand it. It is to be noticed that the term invariably denotes some excellency or superiority in the persons to whom it is applied.

The Wharton School of Finance and Economy, connected with the University of Pennsylvania, has a course of study preparatory to journalism, concerning which the school's prospectus makes the following statements: "The position of editor or editorial writer on a journal is one of great responsibility and importance, and no such person can be too well prepared for his work. A course of study in political economy and finance, and in American history and politics, is almost indispensable to any editor who wishes to write intelligently upon the countless subjects of public policy upon which the newspaper must take a stand." Why say "*almost* indispensable"? Do the Wharton instructors intend to admit that there can be any intelligent editorial writing upon questions of public policy by men who have not pursued such a course? That the newspaper "sanctums" of the land are crowded with men who are writing every day without the aid of such preparatory study, every reader of newspapers must admit; but no one can call the wonderful "copy" they are producing "intelligent." Possibly the Wharton School authorities put in the "almost" to avoid the danger of seeming to reflect upon the press of the country as a body. The course of study which they outline is the best that we have seen yet in any quarter for the work in hand, and is, in fact, the only kind which can fit a man for useful and competent journalistic writing. It would, of course, unfit him utterly for "breezy, brainy, newsy, crisp" writing, for the peculiarity of that is, that the less preliminary study of all kinds a man has, the greater will be his success in it.

We remarked the other day, prior to the action of the New York Presbytery unfavorable to Prof. Briggs, that it was only a question of time before his views would win acceptance in his denomination. The striking array of young ministers who voted to sustain him is in strong confirmation of our opinion. They were not alone graduates of Union Seminary, and so naturally disposed to defend a professor under whom they had studied; even the Princeton graduates are going the way of the higher criticism, if you can only catch them young enough. Three young ministers of Princeton training now occupy prominent pulpits in the Presbyterian pulpit of this city. That fact was given considerable prominence not long ago as an instance of the way Princeton men were coming to the front, even under the shadow of Union Seminary. But they all support the accused Union Seminary professor, and one of them figures as his avowed defender. For the present the gray heads and the superannuated ministers no longer in the active pastorate have the weight of numbers. A few years will reverse the balance. Only, the pity of it is that, by the time the victory is won, the issue will have become obsolete for the educated world, other questions will be the living ones, and then we shall see these progressive young men metamorphosed into the stern excommunicators of the progressive young men of the next generation.

The long contest over the opening of the Metropolitan Museum on Sunday was brought to an end on Monday by the surrender of a majority of the Trustees to a monster petition, accompanied by a guarantee of the increase of expenditure for one year. Only two objections to the opening have been produced from the beginning of the agitation. One was, that the collection was the result of contributions from individuals most of whom were opposed to the opening on Sunday, and that as their continued pecuniary support was of the last importance, their wishes should be respected. This dwindled, in the course of the discussion, into an acknowledgment that the wishes of these gentlemen might be disregarded if the money could be found to meet the increased expense which the Sunday opening would entail. The other objection was the one known as "the entering wedge," which was set forth in the petition signed by a good many leading clergymen of the city. Their contention was that the opening of the Museum on Sunday would be "a perilous experiment, opening the way to Sunday theatres and operas, beer gardens, music and dance halls, and the features of what is called a Continental Sunday." How it can be considered "a perilous experiment" we do not know, seeing that it has been tried with regard to similar institutions in Boston and Philadelphia for ten years, and has been perfectly successful. Nor do we clearly understand what is meant by "opening the way," seeing that by no possible effort of the imagination can the Museum be looked on as stopping or having stopped the way to a "Continental Sunday."

The truth is, that the old Puritan Sunday for which the signers contend, disappeared from this city long ago. The great bulk of the population have for fully a quarter of a century been passing Sunday either in the Continental fashion or some worse fashion. That is to say, they have either been amusing themselves on Sunday as Frenchmen or Germans generally do, or in ways far more objectionable. To suppose that the closing of the Metropolitan Museum on Sunday has exerted the smallest influence on this tendency, is to be in the highest degree fanciful. We doubt if the denial of access to the Museum on Sunday has sent a single human being in this city to a place of worship, or kept a single human being away from any place of amusement, or modified the views of a single human being on the question which were right—Anglo-Saxon Protestants or Continental Protestants—touching the nature and requirements of Sunday observance. What the closing of the Museum on Sunday really stood for was the scruples of a small and highly respectable body of gentlemen whose authority in matters of art every one respected, but whose authority on questions of ethics, or Biblical or historical criticism, had no weight at all. The Museum on Sunday was, in fact, simply a little island in the midst of a mighty current which was carrying everything else before it. The civilized world may be said, without exaggeration, to have decided against the Jewish view of the Sabbath. Whether this will prove eventually a good or bad thing, no one can tell, but it is final. Our opinion is that the moral interests of all the Western communities will be helped by it, certainly in the great cities, where the temptation on the part of non-church-goers to pass the day in sordid lounging, in the absence of innocent and refined amusements, is so strong.

The financial question has been the black one for Spain for many years, and the latest proposals of the Government are not of a sort to promise a lasting settlement of the difficulty. The truth is, the country has been running behind steadily for more than a decade. The floating debt is at present upwards of $60,000,000, being the amount by which expenditures have exceeded receipts since the slate was sponged clean ten years ago. Every Minister of Finance, during this period, has made out a roseate budget in advance, but the estimates have invariably turned out ludicrously wide of the mark. The Opposition is always charging the Administration with imbecility in the management of the finances, and is always going the same old bad way when it comes to power. Thus great things were expected of the Cánovas Ministry, but nothing is forthcoming but another of the familiar shifts to stave off the evil day. The Bank of Spain is to loan the Government $30,000,000 for thirty years without interest, and in return for this favor is to receive highly valuable considerations. In the first place, its charter, including the exclusive privilege of issuing bank notes, is to be extended seventeen years. It would expire in 1904, but is now to run till 1921. Then, no limit is to be put upon its issue of bills. The bank's capital is at present $30,000,000, and it is not authorized to issue notes beyond the amount of $150,000,000. With its capital thus multiplied by five, its privilege is already immensely valuable, and enables it practically to absorb all the banking business of Spain. The removal of all limits on its circulation, and the doubling the time its charter has to run, would seem to be cheap at the price it it is proposed to pay for them.

THE ITATA CASE.

THE extraordinary carelessness in matter of law and precedent with which the business of the State Department is conducted under Mr. Blaine, as illustrated by the Reiter incident and the Bering Sea discussion, probably accounts for the confusion of the public mind at this moment touching the rights and wrongs of the chase of the *Itata* by a United States man-of-war, now going on. There are only three classes of vessels which our men-of-war can chase and capture on the high seas—*i. e.*, outside of our jurisdiction—viz., slave traders, enemies, and pirates. The *Itata* is confessedly not a slave-trader; she is not an enemy, because we are not at war with any Power. Is she a pirate? Nobody pretends that she is. A pirate is a vessel which carries no national flag and has no commission from a government. The *Itata* carries the flag of the Chilian Congressional party, now carrying on a civil war in that country.

What is our proper attitude towards the parties to a conflict in a foreign country, which, through its persistence and the force displayed on both sides, has risen to the dimensions of a civil war? There is no difficulty in answering this question. Authorities on the subject are plenty as blackberries. Wheaton says, "that a foreign Government may either remain neutral or take part in the conflict [civil war]. If it remains neutral, it is bound to allow impartially to both belligerent parties the free exercise of those rights which war gives to public enemies against each other" (Lawrence's ed., p. 40). Bello says, "When a republic is divided into two parties which mutually treat each other as enemies, the war is called *civil war*, which means war between fellow-citizens. . . . Howsoever much one of the two parties gives to the other the title of rebel or tyrant, the foreign Powers who desire to maintain their neutrality ought to consider both *as two States*, independent as respects one another and other States who recognize no judge of their differences" (Lawrence's note to Wheaton, p. 524). Says Attorney-General Black, in his opinion given under Buchanan in the Peru controversy in 1858, "When the people of a republic are divided into two parties, who take up arms and oppose each other by military force, *this is civil war*. Supposing, however, that the rebellion is partly successful, and the old Government maintains itself in one part of its territory, while it is obliged to surrender another, shall it then give the law where it has no power to enforce obedience, or shall its authority be confined to the territory it occupies? A revolutionary party, like a foreign belligerent Power, is supreme over the country it occupies as far and as long as its arms can maintain it" (Opinion of Attorney-General Black, May 15, 1858, Congress. Doc. Thirty-fifth Congress, first session.) Secretary Cass endorsed this opinion in the same controversy. It accords with that of the Supreme Court in the case of Rose v. Himley, Cranch's Rep., vol. iv., p. 272; also in several prize cases which came before the Supreme Court in the December term in 1862, when the court laid down as one of the rules governing the matter in hand: "War is that state in which a nation prosecutes its right by force, and it is not necessary that both parties should be acknowledged as independent nations or sovereign States, nor that war should be solemnly declared. As civil war *is never publicly proclaimed, eo nomine*, its actual existence is a fact in domestic history which the courts are bound to notice and know." Hall, the latest writer on international law, while acknowledging that belligerents in a civil war cannot demand recognition as a matter of strict legal rights, says they always receive it when the hostilities bring them into contact with a neutral foreign State (p. 36-7).

It is an easy inference from all this that if the *Charleston* should overtake the *Itata* now, she would find her a public commissioned ship, and, if she attacked and destroyed her, would be violating our neutrality by taking part in the hostilities on the side of President Balmaceda. The title of the Chilian Congressionalists to belligerent rights is made doubly strong by the fact that they are or were the most important part of the regular Chilian Government. The pretence that the Congress recently elected in the part of the country held by Balmaceda's troops, and doubtless under his military supervision, takes the place of the ante-bellum Congress, is too absurd for discussion. There can be no election in Chili of a legitimate Congress until peace is restored.

But it is said, the *Itata* violated our neutrality laws, and therefore we have a right to pursue and capture her wherever found, as a fugitive from our justice. Our neutrality laws are domestic legislation, governing, like all other domestic legislation, all persons within our jurisdiction as long as they are within it. Persons who violate them, however, like other criminals, can only be captured within our jurisdiction. If the *Itata* were an American ship, she could be pursued and captured anywhere on the ocean, because we have jurisdiction of American ships on any part of the high seas. But we have no more right to capture foreigners on foreign ships on the high seas, unless they are pirates, slave-traders, or enemies, than we have to pursue forgers or murderers into Canada or Mexico. Since Mr. Blaine began his Bering Sea controversy, the notion has got into many heads that the United States can exercise police powers over the whole ocean under the United States statutes; but this notion, though pleasant and gratifying to the national pride, will not bear legal examination. If there be only one nation in the world which should stand, as it has always stood, for law, in these matters, we are that nation. On this particular point of the responsibility of neutrals (since the *Alabama* case) for the departure from their ports of vessels partially prepared for war, and receiving their armaments at sea, for which we contended before the Geneva tribunal, Hall says:

"The intent of acts, innocent separately, but rendered by this theory culpable when combined, can only by their nature be proved when the persons guilty of them are no longer within neutral jurisdiction. They cannot, therefore, be prevented by the State which is saddled with responsibility for them; and this responsibility must mean either that the neutral State will be held answerable in its own body for injury suffered by the belligerent, in which case it will make amends for acts over which it has had no control, or else that it is bound to exact reparation from the offending belligerent, at the inevitable risk of war.

"If this doctrine were a legal consequence of the accepted principles of international law, it might be a question whether it would not be wise to refuse operation to it on the ground of undue oppressiveness to the neutral. But no such difficulty arises; for, as responsibility is the correlative of power, if a nation is to be responsible for innocent acts which become noxious by combination in a place outside its boundaries, it must be enabled to follow their authors to the place where the character of the acts becomes evident, and to exercise the functions of sovereignty there. But even on the high seas it is not permissible for a non-belligerent State to assume control over persons other than pirates or persons on board its own ships; and within foreign territory it has no power of action whatever" (Hall's Int. Law, p. 610–11).

This means, among other things, that we cannot scour the ocean in quest of foreign offenders against our laws. Our remedy for the offence of the *Itata*, whatever it be, is at present to be sought from the Chilian Congressionalists by formal application. Whether she has committed an offence remains to be determined, for it is good law that American citizens may sell ships fit for war to foreign belligerents even, no matter where they take on their armaments. At all events, the fact and nature of her offence are to be settled by the courts, and not by the captain of the *Charleston* and by the Secretary of the Navy crying, "Sic 'im! Sic 'im!"

THE ALABAMA PRECEDENT.

THE New York *Times* produces, as an authority for the pursuit of the *Itata*, the judgment of the Geneva Tribunal in the *Alabama* case, which, as quoted by the *Times*, was as follows:

"And whereas, with respect to the vessel called the *Alabama*, it clearly results from all the facts . . . that the British Government failed to use due diligence in the performance of its neutral obligations, and especially that it omitted, notwithstanding the warnings and official representations made by the diplomatic agents of the United States during the construction of the said No. '290' [the *Alabama*], to take in due time any effective measures of prevention, and that those orders which it did give at last for the detention of the vessel were issued so late that their execution was not practicable;

"And whereas, *after the escape of that vessel, the measures taken for its pursuit and arrest were so imperfect as to lead to no result*, and therefore cannot be considered sufficient to relieve Great Britain from the responsibility already incurred; . . . .

"Four of the arbitrators, for the reasons above assigned, and the fifth for reasons separately assigned by him, are of opinion that Great Britain has in this case failed, by omission, to fulfil the duties prescribed in the first and third of the rules established by the sixth article of the Treaty of Washington. . . .

"The Tribunal, making use of the authority conferred upon it, . . . awards to the United States a sum of $15,500,000 in gold as an indemnity to be paid by Great Britain."

We could not have desired a better illustration than this of the soundness of our position as to what kind of pursuit is permissible on the high seas to national vessels.

To know what the "pursuit" was which the Tribunal condemned as "imperfect," we must go to the American pleadings to see on what grounds the American counsel sought redress against Great Britain. There is a volume lying before us now, entitled 'The National and Private *Alabama* Claims,' published in 1871 by Charles C. Beaman, a well-known member of the New York bar, containing an elaborate and careful statement of the American claims before arbitration was decided on. In this work, which we commend to the perusal of the editor of the *Times* as containing a very complete history of the neglect by Great Britain of her neutral duties, he will find at p. 226 the following summing up of what Great Britain ought to have done after the escape of the Confederate cruisers from her ports:

"(1.) She could have withdrawn the protection given to them by the Queen's proclamation.
"(2.) She could have seized them in any English port.
"(3.) She could have forbidden their entrance into any English port."

Nothing here about pursuit and capture on the high seas.

Now, let us turn to the American case as presented to the Geneva Tribunal by the American counsel, and see what that says as to the nature of the British shortcomings. The counsel of the United States, applying the "rules" agreed on by the Treaty of Washington to the conduct of the British Government regarding the Confederate cruisers built or equipped in British ports, say ('Papers relating to Treaty of Washington,' vol. iii., p. 186):

"(*a*.) The British Government did not use due diligence to prevent the fitting out, arming, or equipping, within its jurisdiction, of certain vessels which it had reasonable grounds to believe were intended to cruise or carry on war against the United States.
"(*b*.) The British Government did not use like diligence to prevent the departure from its jurisdiction of certain vessels to carry on war against the United States, such vessels having been specially adapted, in whole or in part, within such jurisdiction, to warlike use.
"(*c*.) The British Government did permit or suffer the belligerent rebels of the United States to make use of the ports or waters of Great Britain as the base of military operations against the United States, or for the purpose of renewal or augmentation of military supplies, or arms, or the recruitment of men for naval warfare.
"(*d*.) The British Government did not use due diligence in its own ports and waters, and as to all persons within its jurisdiction, to prevent any violation of the stipulated rules (article vi.).
"(*e*.) Finally, the British Government has failed to fulfil certain duties, recognized by the principles of international law, not inconsistent with the foregoing 'Rules.'"

There is not, in fact, either in the correspondence, or negotiations, or litigation arising out of the *Alabama* claims, the shadow of a suggestion, much less an assertion, that Great Britain was bound or had the right to pursue any of the escaped Confederate cruisers on the high seas.

What, then, did the Tribunal mean by saying "that, after the escape of that vessel [the *Alabama*], the measures taken for its pursuit and arrest were so imperfect as to lead to no result"? It meant that after the escape of the *Alabama* from Liverpool, July 29, she ran into Moelfre Bay and there, in *British waters*, remained unmolested, taking crew and equipment on board from Tuesday night, July 29, to the morning of August 1. It meant that no orders were sent to the collectors to seize her in any British ports till the evening of July 31st. It meant that she ran into the British port Port Royal, Jamaica, where she provisioned and coaled without hindrance, as well as into various other British ports, and finally, a year later—August, 1863—actually lay in British waters, Saldanha Bay, at the Cape of Good Hope, for several days, sallying out therefrom to make captures in full sight of the inhabitants and of a British man-of-war, and returning afterwards to her anchorage. In short, England was condemned for not capturing her when she came back within British jurisdiction. The pretension on which the cruise of the *Charleston* is based was never set up or heard of in the controversy.

A writer in the *Sun*, dating his letter from Washington, points out very sensibly that the *Alabama* furnished a much worse case of the violation of neutrality laws than the *Itata*, inasmuch as she was a British ship, built in England for warlike purposes, and intended to be used as a man-of-war by a foreign belligerent. She, therefore, put the neutral obligation to stop her, as against England, in the strongest shape it could assume. It could not have been made stronger except by her open and complete equipment as a man-of-war in the port of Liverpool. There is no proof that the *Itata* was intended to be used as a fighting ship in any way whatever. We see by the Washington correspondence of both the *Times* and *Tribune* that Secretary Tracy was in the State Department on Sunday studying the law of the "chase" on which he has sent the *Charleston*, and that he has become "strengthened in his conviction," the *Times* says, that he has the legal right to "seize the *Itata* anywhere on the high seas." It seems a great pity that the Secretary of the Navy, as well as Mr. Blaine, could not study the law of their various enterprises before plunging into them. The time to examine neutral rights and duties thoroughly, and on Sunday if necessary, is before and not after having sent cruisers to sea with orders to commit acts of hostility. It is the more necessary to say this because Secretary Tracy has already contributed some striking novelties to international law—notably the rule that a naval commander is not only bound to protect fugitive foreign criminals, on board American ships, from the local police in ports of their own country, but to cruise outside, when he hears they are coming, and escort them to "the haven where they would be"; and that an officer who does not do this is not fit to command an armed ship. We are sure this was evolved from his inner consciousness, and was not the result of an examination of the books.

We observe that he has told the *Tribune's* Washington correspondent that "the confusion" in the minds of his critics seems to arise "in failing to distinguish between the right to pursue and seize an offending ship and the obligation to pursue." We do not know where this distinction exists except in his own head. The right fixes the measure of the obligation. Whatever we can do in reason we are bound to do. The British Government was not expected to put a battalion of infantry on board the *Alabama* to prevent her escape, and, if it had been bound to pursue her, would not have been bound to send a fleet after her, or anything more than a ship likely to catch her and overpower her if she resisted. It was bound to do whatever was *sufficient* to prevent her sailing, and whatever was necessary to insure her capture if she returned to British waters, but no more. It may be of some use to recapitulate, both for the Secretary and for the various journalistic pundits who are now hunting up precedents for him, that the *Alabama* case, as regards us, swallowed up all other cases; that neutral rights and duties underwent a more thorough examination before the Geneva Tribunal than they have ever before received; that the Tribunal itself was an illustrious one, and the litigants two great nations, and that the American claims were presented by the pick of our bar, and in their very strongest form; that the right or obligation of Great Britain to pursue and capture on the high seas belligerent vessels guilty of violating her neutrality laws, was not asserted by us; that the finding of the Tribunal, as it stands, took no notice of such right or obligation, and is even now considered unduly severe on neutrals. It would have been intolerable if it had included Secretary Tracy's notion, because every court and moralist would have held that power to put a stop to a wrong always carries with it the duty of exercising the power.

THE FRENCH BIRTH-RATE.

A RECENT number of *La Réforme Sociale* contains a paper on the growth of the French population read before the Société d'Économie Sociale by Prof. Charles Richet, and dealing with what many French publicists consider an alarming national symptom that is to say, the slow growth of the population in France as compared with other countries, notably with England and Germany, and the rapidly decreasing birth-rate. Prof. Richet shows in one table that while France has gained during the last sixty years only six millions of population, England has, during the same period, gained fifteen millions, and Germany twenty-three millions; in another table he shows that the number of births for each 10,000 of population has fallen in France from 261 in 1873 to 237 in 1887, while in England the decline during the same period has been from 378 to 316, and in Germany from 410 to 386. He views these facts with alarm, and suggests some remedies in the way of legislation.

It is not without interest to follow his reasoning in order to see on what slender grounds a man of science can persuade himself to hold opinions on an important sub-

ject. He admits that for a laboring man—that is to say, for the mass of the population—a large family is not desirable; that, both morally and materially, a small number of children will be better nurtured and brought up in a poor household than will a greater number; but he adds that while it may be better for each individual family to be small, it is necessary for the welfare of the country at large that there should be large families. In other words, by adding together the misery of several millions of households, he thinks it possible to build up the happiness of the commonwealth. No less interesting are his reasons for asserting that national happiness is dependent on a large population. A country which has a small population will, he says, ultimately be swallowed up by its more populous neighbors; it will lose its independence; and, what he finds most deplorable of all, its language will not be diffused over the world. It is not that he fears that French will disappear, or will cease to be spoken by the French; one might find it possible to sympathize with such a grievance, even though feeling it to be somewhat sentimental. But when he says, "If we remain stationary, foreigners will no longer be forced to learn French, and French will only be spoken by the French; and that will be only a small matter considering how few Frenchmen will exist in 100 or 200 years," one can only exclaim, "Tant de bruit pour une omelette!" In order that, one or two hundred years from now, Englishmen and Germans shall feel obliged to study French conjugations and declensions, the French workingman of to-day is to give up his ease and raise a large family! Surely this is Chauvinism run mad.

No less antiquated and pre-Malthusian than Prof. Richet's point of view are the remedies he proposes in the way of favoring, by legislation, the fathers of large families, and in the way of burdens to be laid on those who contumaciously even refrain from marrying. All of these remedies and many more have been tried in ancient and modern times, and much more drastically than the spirit of our time would tolerate. The Romans had their bachelors' tax (*æs uxorium*) and their "lex Julia et Papia Poppæa," which brought pressure to bear by limiting the right of inheritance of the unmarried and the childless. In the seventeenth and eighteenth centuries there was well-nigh universal legislation of this kind, the most thoroughgoing specimens being a Spanish edict of 1623 and one of Louis XIV. in 1666, which not only granted exemption from taxation, but positive subsidies in cash, as an inducement to early marriages. Those were the golden days of McKinleyism, which our degenerate age can never hope to equal. While there is good reason, on general grounds, to doubt the efficacy of legislation in modifying aggregate human conduct permanently and on a large scale, there are special physiological reasons operating in the case in hand which are likely to make all such interference particularly futile. Some nations seem to be naturally and organically more prolific than others. Frenchmen who are dismayed at the superior fecundity of the Germans may derive some comfort from the reflection that, 1,100 years ago, the author of the Lombard History said that Germania had better be called "Germinania." A diminished birth-rate is sometimes the cause and sometimes the effect of a high degree of national well-being. In his recent Utopian romance of 'Freiland,' Theodore Hertzka remarks that well-fed animals are as a rule not prolific; that, as regards the human race, the poor have more children than the rich; that even the ancient Romans had observed this fact, as witness the etymology of the word "proletarian"; that in Europe, Russia, economically considered, the poorest country, has the highest birth-rate, while France, which has the lowest, is the country in which for a century there has been the most equal division of wealth. The greater birth-rate of England he attributes to the unequal distribution of its wealth. Of similar import is a still more recent outgiving of Paul Leroy-Beaulieu, to the effect that the birth-rate is declining all over the world, and most so where democracy is on the increase and the individual has emancipated himself from the old beliefs and ideas, and has become imbued with the equality of conditions—that is to say, has come to regard the acquirement of wealth and distinction as the principal object of life.

If thirty-nine millions of Frenchmen can manage to lead a comfortable and equable existence, why should it worry them that Germany has fifty-two millions? If emigration offers any indication of welfare, the French are far better off than the Germans, for while a million and a quarter have left Germany during the past ten years, less than a hundred thousand have gone out of France. Heine's saying that when a German is oppressed beyond endurance by his Government he emigrates, while a Frenchman in a like case makes the Government emigrate, is perhaps no longer applicable, the conditions having changed somewhat in the last seventy-five years. In view of the present prevalence of Socialistic cant and of the remarkable recrudescence of paternal theories of government, it may seem old-fashioned to say so, but we are very much of the opinion that the most likely way for any nation to be happy is for all the individuals in it to be happy; and that the most likely way for an individual to be happy is to have his own way in life, as far as is compatible with the right of every other man to have his way. This rule is as applicable to the matter of marrying and raising children as to any other concern of life, and every ordinarily intelligent man will be better able to judge of what it behooves him to do in that regard than any college professor or member of a legislature or newspaper editor can do for him. Neither need any citizen feel bound to postpone his own present happiness to any consideration of what may become of his country a hundred or two hundred years hence. He can neither foresee nor avert the future; and if he could, it would be futile to do so. As long as a nation is fit to exist it will continue to exist; if it is not fit, the sooner it makes room for one that is, the better. If the French or any other people are doomed to extinction, it must be for deep-seated organic reasons, which no legislation or rhetoric can reach.

AMERICAN ORIENTAL SOCIETY.

BOSTON, May 16, 1891.

THE American Oriental Society held its spring meeting in Boston and Cambridge during the past two days. This is the last of the half-yearly meetings which have been held since the year 1848, the Society having decided to hold one meeting a year of longer duration during the Easter week. The General Court of Massachusetts has just passed a bill authorizing the Society "to hold its meetings in any State or Territory of the United States and in the District of Columbia; provided, however, that the said Society shall meet within this Commonwealth at least once in three years." The Society is thus enabled to accommodate itself to the rapid growth of the study of Oriental languages in all our great universities, and to meet in rotation at the different centres of Oriental learning. It was also resolved to abolish the classical section of the Society, the American Philological Association doing all the work in this line of research.

The following officers were elected for the ensuing year: President, Rev. Dr. William Hayes Ward of the *Independent;* Vice-Presidents, President Daniel C. Gilman of Johns Hopkins University, Prof. J. Henry Thayer of Harvard University, Prof. Isaac H. Hall, Metropolitan Museum of Art; Recording Secretary, Prof. David G. Lyon, Harvard University; Corresponding Secretary, Prof. Charles R. Lanman, Harvard University; Directors, Prof. Paul Haupt, Johns Hopkins University; Prof. R. J. H. Gottheil, Columbia College; Prof. M. Bloomfield, Johns Hopkins University; Prof. John Phelps Taylor, Andover Theological Seminary; Prof. Edward W. Hopkins, Bryn Mawr College; Prof. A. L. Frothingham, Princeton College; and Mr. Talcott Williams of the Philadelphia *Press.*

Prof. David G. Lyon, the Curator, escorted the members through the new Semitic Museum of Harvard University, which has lately been established through the generosity of Mr. Jacob H. Schiff of New York. The Museum consists chiefly of casts of the principal Assyrian and Babylonian monuments in the British Museum and the Louvre. There are, however, quite a number of originals—Babylonian contract tablets and seals, Arabic, Hebrew, and Syriac manuscripts, and some Arabic coins. The announcement was made, through Provost Pepper, that the important collection of Babylonian and Assyrian antiquities in the museum of the University of Pennsylvania would be open for the use of scholars from July 1, 1891.

Nearly forty papers were presented, and it was very gratifying to note that a number of them came from the younger members of the Society, as it evidences the growing interest shown in these lines of study. Six papers were presented by men from the graduate department of Yale University, four of them being students of Dr. Robert F. Harper. Mr. Lester Bradner (Yale) discussed the "Order of the Sentence in the Assyrian Historical Inscriptions," Mr. Carl J. Elofson (Yale) "The Position of the Adjective in Assyrian," and Mr. Charles F. Kent "Annection in Assyrian." Mr. James H. Breasted (Yale), in a paper on the "Order of Words in the Hebrew Portions

of Daniel," showed by the decay of syntax the probable late date of the Book of Daniel. By the comparison of the syntax in this book with that in three others, he arranges their position in time as follows: Ezekiel, Malachi, Ecclesiastes, and Daniel—a conclusion which is verified by other considerations. Prof. Nestle of Tübingen sent a note on verse 31 of Psalm 68. Dr. Robert F. Harper (Yale) discussed "Some Syntactical Points in the Esar-haddon Inscriptions," and Prof. William R. Harper (Yale), "Some of the Imperfects in the Deutero-Isaiah." Mr. George N. Newman (Yale), in a paper on "Contraction in Arabic," laid down the rule that "all change occasioned by the presence of weak letters is brought about directly by the vowels; and the nature of the resulting change is subject directly to the nature of the vowels present."

Mr. James R. Jewett (Brown) presented a collection of "Arabic Proverbs and Proverbial Phrases," collected, translated, and annotated. Mr. George A. Reissner (Harvard), in a paper entitled "Comparison of Assyrian, Hebrew, and Phœnician Proper Names," showed how the same general forms are found in the proper names of these languages, and upon what general principles these names are built up. Prof.-elect George A. Barton (Bryn Mawr) discussed Esar-haddon's account of the restoration of Ishtar's Temple at Erech. President Charles W. Benton presented the Arabic text and translation of the preface of the 'Book of the Meeting of the Two Seas,' by Nasif el Yaziji.

Prof. Isaac H. Hall (Metropolitan Museum) gave a "Tentative Bibliography of the Syriac Publications in the Neighborhood of Oroomiah." Prof. Hall also presented photographs of a bronze statuette recently acquired by the Metropolitan Museum of Art. It was found at Pietralgina, in Benevento, Italy. It represents Hercules after a Greco-Phœnician concept. He is in the attitude of attack, and has on the lion's skin and carries the bow. It has been proved to be not five years away from the year 330 B. C. by means of coins belonging to the Phœnician dynasty of Citium, and by Phœnician inscriptions in the Metropolitan and British Museums. Prof. R. J. H. Gottheil (Columbia) read a paper on "An Unknown Syriac Grammarian," and a note on the Alhambra vase in the possession of Mr. Charles A. Dana, which turns out to have been made within the last twenty-five years and not to be a product of remote antiquity.

Dr. Herbert C. Tolman (Yale) discussed the "Syntax of the Old Persian Inscriptions"; Prof. A. V. W. Jackson (Columbia) spoke on the native place of Zoroaster. His origin is disputed, one tradition placing it in Media, the other in Bactria. The 'Bundahish' says that on the river Darya was the home of Zaradusht. Two passages in the 'Avesta' embody the same tradition. We have, probably, to think of the river Darya in Atropatene. He was probably cast out of his own country, so that his activity was in the East; hence the double tradition. Prof. W. D. Whitney sent a paper "On the Perfect and Imperfect in the Brahmanas." The two tenses seem to be mainly equivalent in signification. They are freely mingled, though the general preference for the imperfect is greatly marked. The increased use of the perfect is, at times, a sign of a later date. Prof. Edward W. Hopkins (Bryn Mawr) spoke of the "Development of the Vedic Yama from an Earthly King of the Blessed to a Lord of Hell." This process was the result of the Indra cult. Indra became the chief god, and Yama was put down; then, all that was left for him was to be lord over the bad.

Mr. Lysander Dickerman spoke of the tablet discovered by Mr. Wilbur near Phylæ which alludes to the seven years of famine in Egypt. It seems to belong to the Ptolemaic era, and the material to be taken from the Septuagint. Dr. Samuel A. Binion described the Abbott collection of Egyptian antiquities now in the New York Historical Society's rooms, and Dr. F. Wendel the Egyptian antiquities in the Peabody Museum at Cambridge. Professor Charles R. Lanman (Harvard) called attention to "Jars with Distinctive Marks of Sex." Such jars are mentioned in the Hindu burial service. Schliemann has found them during his excavations, and they have turned up in China, Japan, and Ecuador. Some of the South American specimens were shown and explained by Professor Putnam, the Curator of the Peabody Museum.

The Society adjourned to meet at Easter, 1892. R. J. H. G.

TABLE-MOUNTAIN ARCHÆOLOGY.

OBERLIN, May 9, 1891.

BY an interesting coincidence, at the meeting of the Geological Society of America, at Washington, last winter, Mr. George F. Becker, the United States Geologist in charge of the survey of the gold-bearing gravels of the Pacific Coast, and myself were both prepared to present new and most important evidence sustaining the conclusions of Prof. J. D. Whitney concerning the genuineness of the reported relics of man from under the lava of Table Mountain, near Sonora, California. The report of Mr. Becker, in a bulletin of the Geological Society, has recently been published accompanied with photogravures of the objects to which it relates. And, as I write, there has just been placed on the table before me the stone mortar itself to which my report related, but which I had not seen until its arrival today from California. The efforts to throw doubt upon Prof. Whitney's reported discoveries have been so persistent and widespread that it is important to get the additional evidence before the world as clearly and promptly as possible. To do this effectually it will be necessary to go into some minor details respecting it.

The Calaveras skull was found under the lava of a spur of Table Mountain, near Angel's, in Calaveras County, California, some ten or twelve miles from Sonora, in Tuolomne County. But, in the vicinity of Sonora, Whitney reported the discovery, under the same lava deposit, of the fragment of another skull and some stone mortars such as had been used by man for grinding coarse food. The best authenticated of these have since been destroyed by fire. The objections urged against the genuineness of these relics were based largely upon *a-priori* considerations. First, it was said that both the skull and the utensils indicated a more advanced stage of progress than the race could have attained at that remote period. The skull was by no means indicative of a near approach to the supposed apelike condition of early man. The mortars were all smooth, and so had a superficial resemblance to the neolithic implements described by European archæologists, and by them assigned to a much more recent age than is accorded to the remains of man that are found in the ancient river drift of the glacial period. Secondly, as Prof. Whitney did not make any of these discoveries in person, it was alleged that the evidence was insufficient, and much was said and is still said concerning the tendency of miners to play practical jokes upon scientific men by palming off upon them relics that are not genuine.

The evidence which came before Mr. Becker and myself last summer is of special cumulative weight in sustaining Professor Whitney's conclusions, and in disproving these sweeping statements respecting the mendacity of the miners. The principal object which Mr. Becker presented to the Geological Society consisted of a mortar, about ten inches in diameter, composed of andesite, a species of eruptive rock abundant in the region. The mortar in my possession is six inches and a half in diameter, with a bowl of about half of that width and depth. This also is composed of a fine-grained eruptive rock, but its exact character I have not yet determined. The most significant thing about it, however, is that its smooth outside surface was probably produced by natural and not by artificial means. In short, it is a pebble from the ancient stream worn into an irregular spheroid shape by a natural process. Evidently the maker found it in its present shape, with the exception of the hollow of the bowl. That he has produced, and of course it is smooth. We question very much, therefore, whether any argument can be derived from these mortars concerning the stage of advancement of the people using them. There is no basis for calling them "neolithic."

But whatever inferences may finally be drawn from the character of these utensils, their very existence under Table Mountain is a matter of the highest archæological interest, and with as little repetition of what has been given elsewhere as is possible, we will state the additional evidence confirming their genuineness. It is not necessary to go over again the evidence presented so fully by Prof. Whitney in his 'Auriferous Gravels.' It is sufficient to say concerning this that it is so circumstantial and direct that, if false, it is explainable only on the theory of wholesale and gratuitous mendacity where no object, not even notoriety, was expected to be gained. The same can be said with special emphasis of the new evidence. Mr. Neale, the mining engineer who last August took his affidavit as to the mortar and other utensils now in the hands of Mr. Becker, made the discoveries in 1877; but, as they were not objects of special interest to him, he gave them to Dr. Bromley, a physician of extensive practice in Sonora, and it was from the latter that Mr. Becker received his first information concerning their existence and history. Mr. Neale is still a resident of Sonora, and is a man of property and high reputation. His affidavit, made at the request of Mr. Becker, is that the mortar in question was found by him in person where there was not the slightest trace of any disturbance of the gravel, or of any natural fissure in it by which access could have been obtained, and that it was between two and three hundred feet beyond the perpendicular edge of the lava cap.

Mr. Becker well remarks that while it would have been more satisfactory to himself individually if he had dug these objects out with his own hands, he cannot discover any reason why Mr. Neale's statement is not exactly as good evidence to the rest of the world as his own would have been.

"He was as competent as I," says Mr. Becker, "to detect any fissure from the surface or any ancient workings, which the miner recognizes instantly and dreads profoundly. . . . So far as the detection of a fraud is concerned, a good miner regularly employed in superintending the workings would be much more competent than the average geological visitor. The superintendent sees day by day every foot of ground exposed, and it is his

business to become thoroughly acquainted with its character, while he is familiar with every device for 'salting' a claim. The geological visitor finds a mine timbered and smoked. He cannot fully acquaint himself with the ground, and he is usually unfamiliar with tricks. It is therefore an argument in favor of the authenticity of implements that they have been found by miners."

The evidence in the case of the mortar which has just come into my own possession is equally direct, and even more circumstantial, especially in its bearing upon the absence of any motive to deceive. Mr. C. McTarnahan made the discovery in the Empire Tunnel, owned in part by his father, which penetrated the gravel under Table Mountain 200 feet in from its west side, about a mile and a half from Sonora, and three or four miles from the locality of Mr. Neale's discovery. Mr. McTarnahan is the assistant surveyor for Tuolumne County, and so is familiar with all the shafts and tunnels under the mountain, and is able to locate exactly the position in which this mortar was found. It was found by him in person and taken out with his own hands. As he was not in search of relics, but of gold, he paid little attention to it further than to bring it to the mouth of the tuunel and lay it aside in a place of safety. Here it remained for two years, until Mrs. M. J. Darwin of Santa Rosa, the lady who has now so generously placed it in my possession, chanced to spend a few days in the family of Mr. McTarnahan's father, when it was given to her by a member of the family without any account of its remarkable history. It is doubtful if its history ever would have been known except by some such chance interview with the discoverer of it as mine was last autumn.

The disposition made of these utensils by the mining engineers discovering them shows how unconscious the miners generally are of the significance of such objects, and effectually rules out the theory of fraud. Some additional circumstances related to me by Mr. Scribner, one of the principal witnesses respecting the Calaveras skull, also bear with equal weight against the theory that there was in that case a "put-up job" either upon Prof. Whitney or upon any one associated with him. In relating the story to me Mr. Scribner, who is still a prominent business man at Angel's, gave some additional facts, whose bearing will be readily seen. As stated by Prof. Whitney, Mr. Mattison, the discoverer of the Calaveras skull, gave it to Mr. Scribner, who was then the express agent of the place, and Mr. Scribner gave it to Dr. Jones, an intimate friend practising medicine at Murphy's, a few miles away. The new point of evidence is that, as Mr. Scribner did not give a detailed account of the discovery to Dr. Jones, the latter laid the skull aside, and gave little further thought to the subject until several months afterwards, when Mr. Mattison came to him for professional services, and it was then from Mr. Mattison, and not from Mr. Scribner, that he obtained the facts which have made the discovery so important in the eyes of the world.

It would of course be unfair to ascribe greater importance to this more recent evidence than is to be granted to the earlier evidence presented by Prof. Whitney. But where, as in cases of this sort, evidence is cumulative, the later additions, though in themselves less important, may have the greatest convincing power. A leading objection to accepting Whitney's conclusions has been that similar discoveries had not been made in later years, but this can no longer be said. When we consider the extent to which mining operations under Table Mountain have ceased, the discoveries since 1870 have been all that could be expected, and the present indications are that Prof. Whitney's statement of facts will hereafter be accepted without question, and that the Calaveras skull will no longer suffer neglect from archæologists on account either of theological prejudice or of the gibes of the humorous poet of the Sierra.

G. Frederick Wright.

THE ROYAL ACADEMY.

London, May 1, 1891.

The most notable change in the London art world this year is the closing of the Grosvenor Gallery. A couple of years ago this would have been an event of small importance. The work which had given character to its shows in early days, already had been carried off by Messrs. Hallé and Carr to their New Gallery in Regent Street, and nothing strikingly good or eccentric had been found to take its place. But last year, by throwing the doors of the Grosvenor open to the younger cleverer artists, especially those of Glasgow, Sir Coutts Lindsay succeeded in holding the most interesting and promising exhibition of the season. It seemed as if, at last, the men who break away from academical traditions and see and say things for themselves, were to have a fair chance to appeal to the public. But Sir Coutts apparently thought his Club more profitable than his Gallery, and the painters who had found a temporary refuge in the latter are again at large. Neither the New Gallery, faithful to the primitive Neo-Gothic school, nor the Royal Academy, true to its conventional standard, has shown the least inclination to encourage them or hang their pictures. The result is that this year there is but little relief to the mediocrity and affectation which prevail in the large London galleries.

The Royal Academy is neither better nor worse than usual. Its most deplorable feature is really the utter commonplaceness of its work, both good and bad. From the dull incompetencies of such Academicians as Faed and Sant, Hodgson and Horsley, who of course are on the line, one would turn with pleasure to still more glaring failures if only in them there was the faintest suggestion of individuality. The excellence of men who have learned their trade but do not know what to do with their knowledge is scarcely less depressing. One wanders from gallery to gallery without coming to anything which attracts the eye or holds the attention. Among two thousand exhibits there are necessarily many fairly good things, but their merits, except in a few cases, do not assert themselves. The curious lack of vitality and distinction in modern English art, as exemplified in the Royal Academy, is its most discouraging characteristic. It is no exaggeration to say that the one picture which stands out from the rest, startling in its vigor and animation and cleverness, is Mr. Sargent's "La Carmencita." To turn to it from the lifeless canvases which surround it, is like reading a song by Swinburne after a course of average magazine verse, a page by Pater after columns of *New Journalese*. The portrait overflows with actuality. Even those who may not like it must admit that the brilliant yellow satin gown holds inside it a living human body, and is not a mere stuffed bag like the suit of clothes Prof. Herkomer calls Sir Sydney Waterlow immediately opposite. The work has its faults. The arms are somewhat wooden; that Mr. Sargent can paint much better hands he proves in a delightful portrait of a lady in a red-shot silk dress, hanging in one of the near rooms. But its faults might be still greater, and it would yet hold its own, not only in the Royal Academy, but in any gallery of the world, as the painting of an artist of style and distinction.

The Academicians can hardly be said to have distinguished themselves this year. One knows well enough beforehand exactly what to expect from each of the small minority whose names have been heard of outside Burlington House—large classical subjects from the President, marbles and draperies from Mr. Alma-Tadema, golden-lined drawing-rooms from Mr. Orchardson, Christmas-Annual supplements from Sir John Millais; and so one might go on through the short list. Nor is there any reason why each painter should not have his own little game to play, his own special field to work. Who objects because Titian never tired of filling his canvas with lovely color, because Velasquez repeated again and again his portrait of Philip, because Corot always saw the same beautiful tree in nature? But too often the game of the Academician seems to have been long since played out and to have degenerated into a mere mechanical trick. He seems to be true to certain accepted conventions simply because time has shown him that they go down with the public and sell. The inevitable ballet-girl of Degas may never lose her vitality, but the Greek and Roman ladies of Sir Frederick Leighton and Mr. Alma-Tadema are at times nothing more than academical pot-boilers.

It is the last, however, who makes the best showing in the present exhibition. He has not, during the last few years, exhibited a stronger, sounder piece of painting than his "Earthly Paradise: 'All the heaven of heavens in one little child'"—the picture of a Roman mother leaning over her baby who lies, naked and kicking, on a couch in a Roman interior. The light is more subdued than is usual with Mr. Tadema, and the marbles much less aggressive; they belong naturally to the composition, and are not introduced on purpose to show the cleverness of the painter's technique. The color is rich, the woman wearing draperies of deep violet-blue, with which the cushions on the couch and all the accessories harmonize. But the triumph of the picture is the painting of the child; the rendering of the delicate pink and white flesh tints is delicious, and the modelling firm and refined. It is a pity Mr. Tadema was not content with this one contribution, for contrasting most unfavorably with it is his portrait of Mr. Balfour, as hard as cast iron and about as interesting. Already I have heard it suggested that if its reproduction in black and white, entitled "The Conqueror of Ireland," could be distributed among the Tories, the cause of Home Rule would be gained. Indeed, all that can be said for it is that it may be a trifle better than a portrait of Mr. Freeman-Mitford by the President.

Sir Frederick Leighton, not only in this, but in his two other examples, is far from being at his best. A sense of humor would have kept him from painting his Andromeda with a huge tin dragon sitting on her shoulders as if to shield her from the arrows of Perseus. There may have been a difficult problem to work out in the foreshortening of the figure, but the result is hardly satisfactory, while the composition as a whole has none of the beauty of color or the dignity of treatment which alone can give interest to the modern versions of classical mythology. His "Return of Persephone" is somewhat happier in conception and execution, but it is rather too scattered

in composition and wanting in interest. Mr. Waterhouse is another Academician who turns to Lempriere for subjects which he usually treats with a certain amount of skill and dexterity. This year his choice has fallen upon Ulysses bound to the mast passing through Sicilian waters, while the Sirens, with the bodies of birds and the faces of women, hover about his vessel. It is solidly painted, and the color is good, but as a whole it is sadly unconvincing; one feels that the hospitals and dissecting-rooms of the Salon, brutal as they may be, are far better themes for the painter of to-day.

Good work can always be looked for from Mr. Henry Moore, and his wide stretch of sea, golden in the light of sunset, under a wonderfully luminous sky, must be counted among the few distinguished contributions to the show. It is a pleasure to find that the new Associate, Mr. David Murray, has not followed the example of too many of his predecessors, and made academical honors an excuse for bad work. He is represented, on this his first official appearance, by two excellent landscapes, full of atmosphere and with a fine large feeling of distance. Mr. Orchardson's drawing-room is now called "An Enigma," and, charming and decorative as it is, there is really nothing to be said about it that has not been said many times before; it is but a slight variation of his usual color scheme and the story it is supposed to tell. The same is true of his portraits; there are three at the Academy, and they are not without character, but it is impossible to believe that all his sitters live habitually in the same yellow light and wear the same golden-hued garments.

The other Academicians hardly call for comment. Sir John Millais, except in his landscape work, it is kinder to pass by, as posterity will, in silence. Mr. Herkomer, Mr. Luke Fildes, and Mr. Dicksee have plunged deep into sentiment, but with indifferent artistic success, though their pictures will probably be the most talked about of the season. Even when people are "On Strike," Mr. Herkomer should remember that they still call for at least some little drawing and modelling; Mr. Fildes, rather late in the day, tries and fails to show his "Doctor" in a room illumined by lamp and daylight; while Mr. Dicksee, in his "Crisis," is left far behind in the artistic race by the realistic painters of death-bed scenes that hang annually in the Salon.

It is an outsider who has contributed the only academical picture of note. Mr. Solomon J. Solomon is one of the very few Englishmen who year after year send the large compositions and studies of the nude that are so rare in Burlington House, so common in the Palais de l'Industrie. This time the "Judgment of Paris" has given him his theme, and a very charming result he has obtained. He has placed his three goddesses in a flower-strewn meadow, under the branches of a blossoming apple-tree, on a bright sunny spring day. Juno and Minerva, in soft clinging draperies, sit on either side; Venus stands in the middle, one hand still holding an end of the green robes which have just fallen to her feet. Never has Mr. Solomon shown himself at once so strong and so refined in his treatment of the nude. The drawing in his Venus is scholarly, her pose graceful, and her relations to her surroundings well suggested; she is really in the open air, and not simply a model posing in the studio. The color, too, has great charm; and the sunlight, the masses of pale pink blossoms, the flowers in the fresh turf, are all in accord with the subject of the picture. After Mr. Sargent, Mr. Solomon towers head and shoulders above the other exhibitors.

One of the chief disappointments of the Academy is the failure of the Newlyn School to fulfil the promise given by their early work. The men and women of this school, while they always retained enough of the British love of telling a story in paint to secure the approval of the Hanging Committee, usually told it with a technical excellence that insured the interest and respect of artists. But of late they have taken to producing nothing more nor less than painted photographs, and to using a palette on which black is the one predominating color. This year one is too painfully conscious of the camera in Mr. Stanhope Forbes's "Salvation Army," Mr. Bramley's "For of Such is the Kingdom of Heaven," Mr. Bourdillon's "From the Spanish Main," Mr. Chevallier Taylor's "Departure of the Fishing Boats," to mention a few of the most conspicuous examples. Careful and honest as the work is, it is singularly wanting in life and animation and those very qualities for which photography has made us turn more than ever to art. Mr. Edward Simmons, a young American who lives in Cornwall, and Mrs. Forbes, have not as yet fallen wholly into the photographic trap, while Mr. Adrian Stokes gives us Nature herself in his "Through Morning Mist," though, it is to be regretted, it is Nature in one of her least interesting moods.

No foreigners of note, except Americans, are represented. Israels did send a picture, but a hole was punched through it—no one seems to know how—before press day, and it was removed. A little portrait by Jan Van Beers is clever but not important. Among the Americans, Mr. Frank D. Millet is to the fore with "The Widow," another of his eighteenth-century interiors, full of delightfully rendered detail, treated with his usual refinement; but is there not a danger that in the end everything will be sacrificed by Mr. Millet to this detail? We have seen the same table, the same silver and glass again and again; they are always pleasant to look at, but they seem gradually to be absorbing all other interests in his canvases. Fortunately, Mr. George Hitchcock's "Maternité" already has been exhibited in London in the Goupil Gallery; it has been shamefully skied by the Hanging Committee—a piece of injustice that is all the more unpardonable when one sees below it on the line a comparatively commonplace landscape by Sir John Millais. Mr. Walter Shirlaw and Mr. Walter Gay both have contributed canvases—the latter an interior, the former two landscapes—which, though small in size, rank among the most striking examples of technical merit. And Mr. McLure Hamilton has a clever portrait of Mr. Gladstone, painted evidently from one of the pastel studies he showed in last year's Grosvenor Gallery. To refer to Mr. Stott's "Bathing-Place," first seen in Paris, if I am not mistaken; a Moorish court by Mr. Arthur Melville, a Glasgow man; an Annunciation by Mrs. Marianne Stokes, is to complete the list of paintings that call for even a passing notice here.

The water-color room is sadly dreary; there is not a clever or striking drawing to relieve its dead level of commonplaceness. Nor are matters much better in the architectural room; the architectural draughtsman in England evidently thinks that the more uninteresting his work is to the public, the greater must be its excellence. There is one exception, Mr. Charles E. Mallows, who has modelled his style on that of the better-known American illustrators, and made his drawings not only of more interest to the layman, but of more value to the architect. In the black-and-white collection there are a few good etchings by Mr. Charles J. Watson, who has never produced a more delightful plate than his "St. Jacques Lisieux," with its delicate drawing of architecture and fine feeling for line, Mr. Frank Short, and Mr. William Hole. The latter, however, might be better represented than by his plate after Constable's "Jumping Horse," a painting not in the least adapted to reproduction by etching. Fine, too, is the monotype of a Shepherd by Prof. Herkomer, vigorous in drawing, except in the hands, and with wonderful quality and richness in the blacks. It is worth far more artistically than all his large pictures put together.

The general average of the sculpture always seems higher than that of the painting. It is a branch of art with but small attraction for the amateur or the mere dabbler; it presents too many difficulties to be adopted as a pastime. The consequence is that the work contributed by sculptors always has a greater air of sincerity and genuineness. In many of the small busts and statuettes there is an effort to suggest character which one welcomes, though it may not be strikingly successful. The works of decided importance, however, are few in number. Mr. Alfred Gilbert's chief contribution is a graceful little winged Victory in silver, standing on tiptoe, the palm in one hand, the trumpet in the other, refined in modelling, vigorous in expression. He has also a marble bust of a young girl, very simple in treatment, but full of character in the strongly marked features. A decorative panel in high relief, by Mr. Hamo Thornycroft, may look well as the frieze for the exterior of the Institute of Chartered Accountants in the city of London, but, on the wall where it now hangs, the figures of the four women representing Science seem coarse and heavy. More pleasing is a charming little silvered bust of a child by Mr. Onslow Ford, very Donatello-like in feeling; and far more graceful is "Caprice," probably the most refined study of the nude in the gallery, by Mr. George Frampton, a young sculptor of no little promise. But it would be tedious here to give a catalogue of names and statues. I must, however, at least mention Mr. Harry Bates's bronze group of "Hounds in Leash," admirable in its expression of action and movement, and Mr. Henry A. Pegram's "Sibylla Fatidica," which is not without dramatic power.

The Royal Academy, year by year, shows more and more strongly the folly and absurdity of forty men monopolizing for all their lives what is known as art in England. Of the forty the names of less than a dozen have ever been heard by Americans, while probably not more than twenty are known even to their fellow-artists. How they got into the Academy, and what they do there, must always remain a mystery.

CHOICE OF PRESIDENTIAL ELECTORS BY DISTRICT.

To the Editor of The Nation:

Sir: As there has been some discussion in regard to the district system since the Legislature of Michigan passed the bill providing for such a system in the choice of Presidential electors, it may be of interest to review the history of the choosing of electors.

It is true that the general-ticket system has been used in all the States, with but three exceptions, since 1832. South Carolina chose her

electors by Legislature down to 1868, when she adopted the general ticket; in Florida, 1868, and in Colorado, 1876, the electors were chosen by their Legislatures. At the first Presidential election, 1788, Massachusetts and Virginia chose electors by district, Pennsylvania, Maryland, and New Hampshire on a general ticket, Delaware, New Jersey, Georgia, Connecticut, and South Carolina by the Legislature. New York failed to choose electors, and North Carolina and Rhode Island had not yet ratified the Constitution. Following is a summary of the manner of choosing Presidential electors. It is compiled from *Niles' Register*, Stanwood on 'Presidential Elections,' O'Neil on 'The American Electoral System,' and from various contemporaneous papers. The order of the States is in accordance with their admission into the Union:

	Legislature.	District.	Gen'l ticket.
Delaware..	1788–1828	....	1832–1888
Pennsylv'a.	1800	1816	1788–1796 1804–1812 1824–1888
N. Jersey...	1788–1804 1812	....	1808 1816–1888
Georgia....	1788–1800 1816–1824	....	1804 1828–1888
Connecticut	1788–1820	....	1824–1888
Massachu'ts	1800, 1808 1816	1788–1796 1812, '20-24	1804 1828–1888
Maryland..	....	1796–1832	1788–1792 1836–1888
S. Carolina.	1788–1864	....	1868–1888
N. Hamp...	1800	....	1788–1796 1804–1888
Virginia....	....	1788–1796 1812–1816	1800–1804 1824–1888
New York..	1792–1824	1828	1832–1888
N. Carolina.	1812	1792–1808	1816–1888
Rhode Isl'd.	1792–1796	....	1800–1888
Vermont...	1792–1800 1816	1804	1824–1888
Kentucky..	1792–1796	1804–1824	1828–1888
Tennessee..	1796–1804	1824–1828	1832–1888
Ohio.....	....	....	1804–1888
Louisiana..	1824	....	1828–1888
Indiana....	....	....	1824–1888
Mississippi..	....	....	1824–1888
Illinois.....	....	1824	1828–1888
Alabama...	....	....	1824–1888
Maine.....	....	1824–1828	1832–1888
Missouri....	....	....	1824–1888

All the remaining States have used the general-ticket system except in the two instances above mentioned, namely, Florida in 1868, and Colorado in 1876, when the Legislatures of these two States made the appointments. No votes were cast in 1864 in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas, and Virginia, and in 1868 in Mississippi, Texas, and Virginia.

Owing to the difficulty of finding information which is not conflicting, this list is not complete, but it shows very clearly that the district system is no novelty.

Yours respectfully,

JOHN DICKERMAN.

ADELBERT COLLEGE, May 13, 1891.

TO THE EDITOR OF THE NATION:

SIR: The recent act of the Michigan Legislature in changing the method of choosing Presidential electors deserves to attract even more attention than it has. My vision may be made more keen by the fact that I belong to the party whose ox is gored by the legislation in question; but, after making all due allowance on this score, it still seems to me that the course of the Democratic majority in the Michigan Legislature is likely to have far-reaching consequences adverse to the cause of good government and honest politics.

Much may be said on both sides as to whether or not, as a general rule, it would be better to select all the electors by districts rather than by general ticket. Until some more effectual way of restraining gerrymandering can be discovered, I think the general ticket will in practice prove the fairer method. A plurality of 1,100 gave New York's thirty-six votes to Mr. Cleveland in 1884, and a plurality of 2,500 carried Indiana for Gen. Harrison in 1888. The practical result was, that these States were counted as if their people had been unanimous instead of being, as they were, divided with almost precise equality between the opposing candidates. Yet, unjust as this seems, it was not as bad as it would have been had the minority in Indiana elected eleven of the fifteen electors, as, under the Michigan plan, they would have done.

Moreover, there is no limitation on the gerrymandering. The Legislature of a State may provide, as the Legislature of Maryland once did, that some districts shall elect only one elector, and others two, three, or four or even more. A Republican Legislature of New York might form one district out of the seven or eight strongest Democratic Assembly districts of New York city, and provide that it should elect two or three electors, and another district out of the rest of the State and empower it to choose the remaining thirty-three or thirty-four. Such a step is not likely to be taken now, but a few years ago such a proceeding as that of the Michigan Legislature would not have seemed probable. When the practice of attempting to get ahead of the other party by so legislating as to secure an advantage in the choice of Presidential electors once gets started, there is no telling how it will end.

But all discussion as to whether the district or the general ticket is the best is idle if it does not take into consideration the certain fact, that nothing short of an amendment to the Federal Constitution can secure the general adoption of the district system. A State Legislature which knows that its party will in all probability have a plurality in the State at the next Presidential election, or which knows that it must have all the electoral votes of the State to give it a chance to win, will always insist on the general-ticket system. The other plan will only be enacted when, as was the case in Michigan, a party which has not usually been in control of the State happens to get a majority in the Legislature. And just because, if the example of Michigan shall be followed by other legislatures in similar situations, it will become more than ever difficult to elect a legislature of different political faith from that of the locally controlling party, the effect of the Michigan legislation must be bad.

It is hard enough to get honest Republicans or honest Democrats to vote against their Quays and their Gormans. It will be still harder to get them to do so if they feel that they may thus be in 1894, for example, electing a legislature which will so change the method of choosing electors that in 1896 Republican Pennsylvania or Democratic Maryland, without any change in the sentiments of the people, may give a majority of the electoral votes to a candidate for whom only a minority of the people of the State will vote. No argument can be conceived more likely to make the reluctant voter follow the machine direction to vote the ticket straight.

Very respectfully, JOHN C. ROSE.

BALTIMORE, May 16, 1891.

STATE ISSUES IN WISCONSIN.

TO THE EDITOR OF THE NATION:

SIR: Frequent allusions in the *Nation* to political affairs in Wisconsin are greatly misleading as to the political situation in this State. In your issue of May 7, in commenting upon the political outlook in various States, and speaking of the late campaign in Wisconsin, you say: "The issue on which the contest turned in 1890 was a purely State one, arising out of a controversy over the teaching of English in the schools." I desire to present a brief historical summary in proof of the statement that there was absolutely no controversy over the teaching of English in the public schools.

Section 41 of the laws of 1854 provides that "in every district school there shall be taught, in the English language, orthography, reading, etc." In 1869 this law was amended by including additional branches, and providing as follows: "All instruction shall be in the English language except that the district board . . . may, in their discretion, cause any foreign language to be taught by a competent teacher to such pupils as desire it, not to exceed one hour each day." In 1866 the Legislature, in prescribing the qualifications of teachers, provided that "no person shall receive any certificate who . . . does not write and speak the English language with facility and correctness." In 1879 the Legislature passed a compulsory-attendance law, which was made more stringent by subsequent amendments.

In 1889 Gov. Hoard, in his message to the Legislature, recommended that all private and parochial schools be put under the jurisdiction of the county and city superintendents. The Legislature, without formally repealing the law of 1879, passed what has come to be known as the Bennett Law, which practically placed these schools under the control of the local school boards. Sec. 2 of this law required all instruction, however given, to be done to the satisfaction of the local school officers. Sec. 5 of this law declares that "no school shall be regarded as a school under this act unless there shall be taught therein, as part of the elementary education of children, reading, writing, arithmetic, and United States history in the English language." The School Code was revised by the State Superintendent in the year 1890. In annotating this law, he comments upon these provisions as follows: "No school, public or private, and no instruction in the family, or by private tutors, should be recognized as sufficient which does not include instruction in these subjects in this form." It would be difficult to state in more explicit terms the right of the State to assume absolute control of private and parochial schools, or of instruction in the family, than is given in this legal interpretation by Republicans of their own legislation.

The Republican State Convention declared in its platform that "It recognizes as valuable auxiliaries in the work of popular education the private and parochial schools, supported without aid from public funds, and disclaims absolutely any purpose whatever to interfere with such schools, either as to their terms, government, or branches to be taught therein." How it could compel the teaching of four branches in the English language and not interfere with the branches to be taught, was not explained.

In his speech at Milwaukee at the beginning of the campaign, Senator Spooner said: "That the Bennett Law is a perfect law I believe none of its friends insist; that it is not susceptible of constructions which, if enforced, would lead to harm and injustice, I do not find it necessary to-night to controvert, and I do not know that the friends, so called, of that law are disposed to controvert it."

At the opening of the late session of the Legislature, which had a Democratic majority in both branches, a bill was introduced for the unconditional repeal of the Bennett Law. Upon the passage of this bill, only 14 out of the 33 Republicans in the Assembly voted against it, one other being paired. Of the 14 Republicans in the Senate, 10 voted against it. In other words, the Bennett Law was repealed by a vote of 83 to 14 in the lower house, and of 20 to 10 in the upper house. A few days later, a new compulsory law was presented by the Democratic majority to take the place of all previous legislation upon this subject. The Republican members of the two houses held a joint caucus and voted unanimously to support the Democratic bill, although several of their number had already introduced compulsory-attendance bills.

In the conduct of the campaign the Democratic State Central Committee waged a vigorous warfare against the ultra-protectionism of the Republican party. They secured the help of Roger Q. Mills, Wm. MacAdoo, Wm. M. Springer, and John M. Black, and did their utmost to secure the services of Senator Carlisle, Frank Hurd, David A. Wells, and many other distinguished tariff-reform advocates. Reckless extravagance of the Republicans in State expenditures and the private appropriation of interest upon public funds by their State Treasurers also had great weight in determining the result. It is not denied that recent school legislation was an important factor, but the political revolution in Wisconsin was but little, if any, greater than in many other States. The assertion that the issue turned upon the question of teaching English in the schools seems, therefore, a gross misstatement of the facts. The only question affecting the schools was that of the right of the State to control instruction in private schools. I deem it but justice to your readers that this false impression should be corrected.

I enclose copies of the Bennett Law and the new compulsory law. O. E. Wells.

Madison, May 14, 1891.

THE ATTEMPT ON THE TZESAREVITCH.

To the Editor of The Nation:

Sir: The dailies of this date contain news of the attempt made near Kioto to assassinate the Tzesarevitch. The news is probably startling to the people of this country, but is not at all surprising to those cognizant of recent affairs in Japan. Ever since it was known that the Tzesarevitch contemplated visiting Japan, the matter has been a topic of discussion in the vernacular press. Most of the Japanese journals hailed the visit with delight, and were inclined to think that it would be productive of greater amity and closer relations between the two countries, and of much benefit to Japan in various ways. But in a few of the newspapers disreputable attempts were made to arouse ill-feeling and suspicion; in fact, it was actually charged that the Tzesarevitch was to visit Japan as a spy.

It must also be borne in mind that the Japanese have always been jealous, even afraid, of Russia. The latter, ever since her ships, about 100 years ago, began to encroach on the northern island, Yezo, of the Japanese Empire, has been an object of considerable suspicion. By dint of more or less finesse in negotiation, Russia obtained from Japan the island of Saghalien in exchange for the bleak Kurile Islands. This fear of Russian encroachments, by the way, has been one obstacle in the path of treaty revision. I was informed by a well-educated Japanese that one reason why Japan hesitated about giving foreigners the right to own property in the Empire, was because she feared that Russians would buy up the island of Yezo and large tracts in other portions of the land!

The Japanese have also looked with an eye of suspicion on the progress of the Greek Church in Japan. Inasmuch as that body is a state institution, controlled and patronized by the Russian Government, it has been considered a dangerous element in Japan. The magnificent Greek cathedral, towering on Suruga Dai above the city of Tokio, and thus higher even than the imperial palace, is an eye-sore to the Japanese. The deep and widespread influence of Bishop Nicolai and the Greek Church is dreaded as the source of a future political influence.

Whether these opinions are well founded or not, they have been used by demagogues and fanatics to stir up a feeling of distrust of Russia, and were employed recently to arouse suspicion concerning the object of the visit of the Tzesarevitch. These suspicions were not, of course, shared by the Japanese Government, or by intelligent citizens. When the writer left Japan, less than a month ago, elaborate preparations were then making to receive the Tzesarevitch with the respect due to him and the courtesy due from so polite a nation as Japan.

Although the despatches dub the assassin "a Buddhist fanatic, as seems most probable, or a Nihilist disguised as a Japanese," it is quite probable that he was a Shinto fanatic. Very likely he was one of the *Soshi*, a class of young ruffians who, conceited beyond their education, deem themselves called upon to avenge every "insult" to the dignity of the nation. They have a false idea of the *Yamatodamashii* (Japanese spirit) and of true patriotism, and are a disgrace to Japan. It was such an one who killed Viscount Mori for an alleged "insult" to the Shinto shrines of Ise. It was such an one who attempted, but unsuccessfully, to assassinate Count Okume for presuming to negotiate treaties beneath the "dignity" of the Japanese people. It is not surprising, then, that similar fanaticism attempted the life of the Tzesarevitch; but it is unfortunate that it still exists in so progressive a country as Japan. Ernest W. Clement.

May 13, 1891.

THE FRÉMONT LEGEND.

To the Editor of The Nation:

Sir: The recent discussions of the seizure of California in 1846, carried on in the *Century Magazine*, in the *Atlantic*, in the *Overland Monthly*, and elsewhere, would naturally seem to have exhausted the possible sources of information, or at all events the patience of the public; and I should not add another word to the lengthy controversy were it not that, quite unexpectedly, I have just found in a document, whose full text was never before in my hands, an additional piece of original evidence bearing upon the assertion made in the final statement of the late Gen. Frémont, as published in the *Century* for April, 1891. By the courtesy of the editor of the *Century*, who procured this document at Washington, I am enabled to use the same here, since he has made me a gift of it.

In the mentioned paper, entitled the "Conquest of California," Gen. Frémont, just before his death, put upon record his final version of the events of the "Bear Flag Affair." This version, as it stands, differs materially from earlier accounts given by Gen. Frémont, but such comparisons are beside the present purpose. Most noteworthy, however, in the paper of Gen. Frémont, as posthumously edited, is the addition of an expression of opinion, by the late Mr. George Bancroft, to the effect that the actions of Frémont in California, in the spring of 1846, were, although of course not precisely contemplated by the distant Cabinet at Washington, still authorized by the tenor of the famous instructions conveyed to the young engineer by Lieut. Gillespie when the two met at Klamath Lake, May 9, 1846. "If," says George Brancroft, in a letter to Frémont—"if I had been in your place, I should have considered myself bound to do what I saw I could to promote the purpose of the President." This purpose, as the secret agent of the Government, Lieut. Gillespie undoubtedly told Frémont, was "to obtain possession of California." Now such an expression of Bancroft's opinion as the foregoing is, carrying as it does both the great authority of his name as historian and the added weight of the fact that he was then the Secretary of the Navy, must seem, of course, to a reader who does not understand the facts of the case, highly conclusive in Gen. Frémont's favor. And therefore it is that my new document, with a few words of introduction, may still be serviceable to the cause of historic truth.

The historical facts, as I have several times before this had occasion to show, are that every agent of the United States who had anything to do with California received, in advance of the declaration of war against Mexico, orders to do everything to conciliate the Californians; that these orders were communicated to Frémont by Gillespie; that the United States Government, by the personal order of the President, was engaged in April and May, 1846, in an intrigue, carried on by Consul Larkin, with the Californians for a peaceful surrender of their territory in disregard of the central Mexican authority; that the orders of Bancroft to Commodore Sloat, in command of our squadron on the Pacific Coast, were in strict accord with this design, which Secretary Bancroft himself unquestionably shared and coöperated in; and that this design was thwarted by Frémont, who, after he had heard Gillespie's instructions, proceeded almost forthwith to arouse the American settlers in the Sacramento Valley by false reports of dangers from Californian hostility; thereupon attacked the Californians in an irregular warfare before knowing of the outbreak of hostilities in the East; wrought considerable mischief; and thenceforth laid claim to the glory of the "conquest of California." The Cabinet at home, Bancroft included, were, however, deceived by an artful tale, sent home in letters to Senator Benton by his son-in-law, and not rendered any more historical by the Senator in the retelling. All this is a matter of substantial proof. What the reader will, however, here desire to know is, how George Bancroft, forty years later, could still so misinterpret the facts as to express so cordial an approval of Frémont's actually disobedient and mischievous conduct as is contained in Bancroft's letters to the latter in 1886.

The answer, of course, is that Bancroft never

had occasion to scrutinize as historian what occurred in distant California, and undoubtedly took his facts in large part from Gen. Frémont's own statement. How true this is, becomes evident at once when one considers two of the statements made by Bancroft in the private letters to Frémont which are quoted in the article referred to. One of these statements runs thus, speaking of what Gillespie communicated to Frémont at the meeting at Klamath Lake: "It was officially made known to you that your country was at war; and it was so made known expressly to guide your conduct." This statement cannot have been made by Bancroft after any careful review of the record, for it is one that a mere comparison of dates shows to be absurd. Gillespie received his instructions at the end of October, 1845, and left soon after for California. War broke out at about the very moment of his interview with Frémont at Klamath Lake, and this fact was unknown in California, even at Monterey, until the arrival there of Capt. Mervine, late in June, 1846, in the ship *Cyane*. North of San Francisco Bay the news of war came to hand much later. The despatches brought by Gillespie to Larkin and Sloat show that in the autumn of 1845 nobody at Washington knew or could know when the contemplated war with Mexico would break out. Fortune might have prevented it altogether, and both Commodore Sloat's and Consul Larkin's instructions were worded accordingly. It is, therefore, impossible that Bancroft can have used the words above quoted with any historical deliberation, or after any careful review of the past.

The other just-mentioned passage of Bancroft's private letter of approval, written to Frémont in 1886, runs: "The truth is, no officer of the Government had anything to do with California but the Secretary of the Navy so long as I was in the Cabinet." Alas, strange fate that should thus beset our greatest historian on one of the very few occasions when he ever wrote about his own public career! Nothing could better illustrate the danger of trusting to memory after many years. The same number of the *Century* that contains the article from which this passage is quoted, also contains the full text of the despatch from Secretary Buchanan to Consul Larkin which Gillespie brought, and which, speaking in the President's name, and with frequent mention of the President's express and official desires, embodies the actual plan of the Administration for the acquisition of California!

Two absolutely demonstrable errors in so short a space as that of the brief passages quoted from Bancroft's private letters to Frémont, show very clearly that the late historian was not speaking *ex cathedra* when he wrote these words of friendly approval. The well-known legend of the Frémont "conquest" he had heard; he certainly never had examined its sources. For the rest, all the other statements that he makes, in the same place, as to his own and the Cabinet's views in those days concerning California, the importance of getting it, the need of promptness and discretion, and the rest, are indeed, accurate enough. They have long been well-known matters. Properly understood, they form part of the case against Frémont.

This case then reduces itself to the following: Gillespie, as we now know, brought orders which he delivered to Sloat at Mazatlan. These orders related to the action of the Commodore to be taken in case he heard of the outbreak of war between the two countries. Gillespie also brought a despatch from Buchanan to Consul Larkin. This despatch is now printed in full in the *Century* for April. Gillespie brought no other official orders addressed to any one in California. He acquainted Frémont at Klamath Lake with the contents of these instructions, but brought no official order directed to Frémont personally. Frémont, who formerly denied to me absolutely that he was ever acquainted with Larkin's orders, and who insisted upon this denial in a statement deliberately made to me, as historical student, for publication in my own book on California history, has for the first time admitted, in his final paper in the *Century*, that he *did* know of the Larkin despatch, and received it from Gillespie. But he adds that this despatch "was in conflict with our own instructions," so that he and Gillespie, not being under Buchanan's official authority, "dropped this idea [*i. e.*, the plan of "conciliating the Californians"] from our minds," although, as the Larkin despatch itself shows, this "idea" was the President's own. Now these, "our own instructions," can only be the instructions of Secretary Bancroft, to whose official department Frémont himself belonged as little as he did to Buchanan's, but whose instructions to Sloat and Gillespie he shall have regarded as more warlike than were Buchanan's to Larkin.

Is this final version of the Frémont romance more authentic than any earlier version? Let the answer be the text of Bancroft's actual letter to Sloat, dated October 17, 1845, a letter never before printed. The date, as will be seen by comparison, is the same as that of Buchanan's despatch to Larkin. The plan embodied is also the same. The copy here given is officially certified as correct by the Department at Washington, and contains all of the despatch that relates to California—the omitted orders relating to matters connected with the exploration of the Columbia River, and to other matters wholly immaterial for the present inquiry. The original copy was sent, it will be seen, by Commodore Stockton, around the Horn. Gillespie, as secret agent, crossed Mexico with the despatches not written, but carried in his memory, so that they might be safe in case of his detention, and so that he might be able in case of successful passage through Mexico to get the official undertakings in California sooner under way:

U. S. NAVY DEPARTMENT,
WASHINGTON, Oct. 14, 1845.

Com. John D. Sloat, Comm'g U. S. Squadron Pacific:

COMMODORE: This communication will be delivered to you by Commodore Stockton, who takes the *Congress* to the Pacific to reinforce your squadron.

In the judgment of this Department it is expedient that, as soon as practicable after the receipt of it, you should transfer your broad pennant to the *Congress*. Commodore Stockton you will then transfer to the command of the *Savannah*, subject to your orders. You may retain Commander DuPont in duties appropriate to his rank on board the *Congress*, or you may confer the command of the *Congress* under you on Captain Mervine and transfer Commander DuPont to the *Cyane*.

In the event of actual hostilities between the Mexican Government and our own, you will so dispose of your whole force as to carry out most effectually the objects specified in the instructions forwarded to you from the Department in view of such a contingency. Should peace continue, you will still retain your squadron off the coast of Mexico and Oregon.

You will communicate frequently with our Consul at Monterey, and will ascertain as exactly as you can the nature of the designs of the English and French in that region, the temper of the inhabitants, their disposition towards the United States, and their relations towards the central governments of Mexico. You will do everything that is proper to conciliate towards our country the most friendly regard of the people of California.

The length of time requisite to transmit to you despatches from this Department renders it necessary that you should judge for yourself, on the best information that you can obtain, whether it will be safe to detach an exploring party from your squadron.

Should hostilities be not likely to occur, you will detach a part of your squadron to display the flag of the United States in the Columbia. To that end you may select a sloop and a smaller vessel if convenient, and attach to them, for the time being, such professors and other officers as will give the best results to the enterprise. You will, in your instructions to them, warn them of the dangers that attend the entrance to the Columbia River, that they may be on their guard against the swell of the ocean and the bar at the mouth of the harbor, and may run no risk with a vessel of the United States. When the ships are within the Columbia River, some of the officers should seize the occasion to visit the valley of the Wallamet. They should make particular inquiries as to the disposition of the people who reside in those regions, . . . the extent, character, and tendency of emigration from the United States and from other quarters, and generally they should collect such information as will acquaint the Department fully with the condition and prospects of that territory. After this has been done a party may proceed by land to Puget's Sound, or some safe harbor you may designate in the Straits Juan de Fuca, and the vessel detached for the exploring party may meet them there. . . .

The object of this order is to perfect the knowledge of the country of Oregon and to cheer our citizens in that region by the presence of the American flag; and, if peace continues, you will consider this the most important duty assigned to your squadron. If, contrary to present expectation, a state of war should exist, you will endeavor to persuade the crews of the *Savannah*, the *Warren*, and the *Levant* to prolong the terms of their enlistment in order that they may remain in coöperation with the rest of your force. But if affairs remain in their present attitude, you may direct Commodore Stockton to take charge of those three vessels and to bring them to the United States in season for the discharge of their crews within the period of their enlistment. Commodore Stockton, on taking the command of the returning squadron, may hoist his broad pennant. You may direct him on their return, if he can do so without material delay, to touch on his way at places on the Mexican Coast where there may be opportunity of gathering useful information or conciliating kindly dispositions.

. . . . . .

You will take care that the laws of the United States for the government of the navy and general orders in pursuance of them are strictly and sincerely respected and obeyed.

Very respectfully, GEORGE BANCROFT.

These, then, the orders of Bancroft to Sloat, sent in October, 1845, by the secret messenger, were "our instructions" which, according to Frémont's final statement, were in conflict with the letter of Buchanan to Larkin, and which authorized the means that Frémont thereupon took "to carry out the intentions of the President." These means consisted in that irregular attack upon the peaceful Californians whose mischievous consequences are now well known, an attack which was itself a distinct hindrance to the acquisition of California, endangering all our interests in that Territory. The attack was, indeed, opposed to Consul Larkin's plans. It was "authorized" by a despatch which told Sloat to "communicate frequently" with Consul Larkin and to "conciliate" the Californians.

It is also to be noticed that these same instructions seem to have authorized Capt. Frémont to write to Commander Montgomery of the *Portsmouth*, then in San Francisco Bay, at the moment when the young explorer was about to engage in the irregular hostilities of the "Bear Flag affair." There was, of course, good reason why Frémont had still to conceal his hand, in order that he might later have a chance to attribute his action to the necessities of self-defence. What he wrote to Montgomery, therefore, ran at one point thus (see *Century* for March, 1891): "The nature of my instructions, and the peaceful nature of our operations, do not contemplate any active hostility on my part, even in the event of war between the two countries." If one compares these words with the final account of Gen. Frémont concerning the "conquest," one sees afresh with what manner of romance one has to deal.

I regret, then, very much that our great historian's name has been made use of, so soon after his death, for so unhistorical a purpose

as that of the posthumously published Frémont narrative. Nobody respects Bancroft's memory more than does the present writer. His actual part in the seizure of California has long been known through other of his despatches, all of a similar tenor. He repeatedly instructed Sloat to seize the defenceless California ports at the outbreak of war, but to keep the inhabitants neutral if he could, to conciliate, and not to assail them, to show irresistible force, but to show every kindness as well. This policy Frémont, who was, indeed, not under Brancroft's immediate orders, lawlessly thwarted for his own glory, whereof he got a good deal. I should myself never think of attacking the Frémont legend so often, were it not so unsubstantially immortal. I shall rejoice, indeed, if ever the pale ghost ceases to walk in broad daylight. The twilight regions of our historical consciousness in this country will probably never be rid of it.

JOSIAH ROYCE.

CAMBRIDGE, MASS., May 10, 1891.

Notes.

D. C. HEATH & Co., Boston, are about to issue a 'Comparative View of the Executive and Legislative Departments of the Governments of the United States, France, England, and Germany,' by John Wenzel, Assistant Librarian of the College of Liberal Arts, Boston University. The arrangement is by parallel columns.

Lee & Shepard announce a second series of the 'Speeches and Lectures of Wendell Phillips,' uniform with the first series; a reissue of 'The Life and Works of Horace Mann,' in five volumes; and 'Gestures and Attitudes, based on the Delsarte Philosophy of Expression,' by Edward B. Warman, with illustrations.

T. Y. Crowell & Co. announce 'Famous English Statesmen,' by Mrs. Sarah K. Bolton; 'A Score of Famous Composers,' by Nathan Haskell Dole; 'Elements of Socialism,' by Prof. R. T. Ely; and vols. iv. and v. of Sybel's 'Founding of the German Empire by William I.'

Houghton, Mifflin & Co. will shortly publish the authorized Life of Robert Browning by Mrs. Sutherland Orr, in two volumes; 'Lewis Cass,' by Prof. A. C. McLaughlin, in the "American Statesmen" series; and 'Ryle's Open Gate,' a story by Mrs. Susan T. Moore.

A translation of Dr. Richard Falckenberg's 'History of Philosophy, from Nikolaus von Kues to the Present Day,' is about to appear with the imprint of Henry Holt & Co.

Macmillan & Co. have in press 'Renascence,' a volume of verse with illustrations by Walter Crane.

Worthington Co. will publish directly 'The Rector of St. Luke's,' from the German of Marie Barnard, by Elsie L. Lathrop.

'My Official Wife' is the title of a novel by Col. Richard Henry Savage, to be brought out by the Howe Publishing Company.

A study of Proudhon, 'Ein Beitrag zur sozialen Reform,' by Dr. A. Mülberger, is in the press of G. J. Göschen, Stuttgart, together with a work in which Dr. Cauer of Tübingen maintains that Aristotle cannot have been the author of the 'Constitution of Athens.'

Just four years ago we were reviewing, in the original French, Boutmy's 'Développement de la Constitution et de la Société Politique en Angleterre,' a work remarkable for its freshness not less than for its evidence of knowledge, grasp, and research. Under the simpler title, 'The English Constitution,' this has now been translated by Isabel M. Eaden, and published, with a commendatory note of introduction by Sir Frederick Pollock, by Macmillan & Co. It makes a compact, handsome volume of 212 pages.

Little, Brown & Co., Boston, have issued, from the original plates, a second edition of the 'Life and Letters of Wilder Dwight, Lieutenant-Colonel Second Massachusetts Infantry Volunteers,' which first appeared in 1867. Ever since the first impression was exhausted, we are told, and we can well believe, there has been a yearly demand for the work, which could not be met. This demand was largely personal, we suppose, but the perennial interest in our civil war might also account for it, and this tribute of affection is as good an exhibition of the highest type of Northern soldier, associated with the highest type of Northern regiment, as could anywhere be found. Col. Dwight was a member of the class of 1853 of Harvard College—a class not a little distinguished for its varied and conspicuous talents, but having also a marked connection with the College subsequent to graduation. Many of his fellow-officers were Harvard men, and, as they figure in his letters, help to make this emphatically a "Harvard Memorial Biography." Dwight left the law to enter the army and lay down his life finally at Antietam. One is made acquainted with a singularly lovable and high-minded personality, and in his letters gets many graphic glimpses of the progress and conduct of the war. The story cannot be read without emotion.

A revival of equal age with the foregoing is the new edition of the 'Journal of Maurice de Guérin' (Dodd, Mead & Co.), but in this case we have also a new translation, by Jessie P. Frothingham. We have compared it with Mr. Fisher's version (1867), now out of print, and find it more literal and on the whole more felicitous. Sainte-Beuve's memoir is prefixed, and the French edition followed is the twentieth. The book would be a pretty one but for the untasteful binding.

A slight examination of the articles in 'Appletons' Dictionary of New York and its Vicinity,' of which the current issue is the thirteenth, makes good the claim to annual revision upon the title-page. But a readier test is the comparison of folios, which shows that the work is not printed from patched plates, but is kept in type for perfect fluidity in modifying and remaking. This is the only practicable course in the case of a work which has to undergo so many even if slight changes. The Dictionary needs no fresh praise. One of the new entries, "Labor Organizations," is a valuable summary account of the fortunes of the Central Labor Union.

'A Lady's Letters from Central Africa,' by Jane F. Moir (Macmillan & Co.), is a very entertaining account of a recent journey from the Shiré Highlands to Ujiji on Lake Tanganyika, by the manager of the African Lakes Company and his wife. At this latter place the travellers were the guests of the leading Arab slave-trader, and an animated description is given of the merry, but curious and impertinent, women of his household. Some distance to the south of this is Karema, a station of Cardinal Lavigerie's "White Fathers." Here, under the care of five men, are several hundred boys and girls who have been bought from the natives or the Arabs when from three to five years old. Each child is taught to work, rarely to read, and "each hoes its little bit of garden, and they are brought up strictly as Roman Catholics," knowing no other religion or superstition. When old enough, the boys and girls live in separate villages near the convent, while the married couples live in still another village a little farther off. This system seems to be far better suited to the natives than that of the Protestant missionaries, "who, so far, have little hold on the people, though they work bravely." Two of these latter "said to us, 'Don't be surprised if some time you find the whole shores of Tanganyika Roman Catholic.'" An attractive picture is drawn of the beautiful country at the northern end of Lake Nyassa, where lovely villages nestle amid endless banana groves. "It is like walking through one vast palm-house or winter-garden, and the beautifully made cow-houses and huts are like ornamental summer houses." "The people, of whom there are thousands, are, almost without exception, very handsome. Especially at Makyusa's the men are magnificent, the larger proportion of them being over six feet high and splendidly made." From these letters, which were not written for publication, it is very evident that the Scotch Lakes Company is doing an admirable work in developing the resources of the country through which it trades, as well as in checking the slave-trade. The work may usefully be read in connection with Prof. Drummond's 'Tropical Africa.'

A shower of new medical books, popular as well as technical, is a constant consequence of an epidemic. One of these, dropping from the grippe of last year, is 'Influenza and Common Colds,' by W. T. Fernie, M.D. (London: Percival & Co.). The therapeutics of the author, "bound by the tenets of no particular school," are those of regular medicine very highly flavored, or diluted, by homœopathy. In view of the recurrence of the pandemic, there is a natural tendency to such reading; but, except in minor disabilities and in the most arbitrary way, it seems that the *cure* of disease is a questionable branch of secular knowledge, whereas avoidance may always suitably be taught. The experienced practitioner might take one or two hints from this little work, but it is doubtful whether the average layman would profit much by it, except as to the early control of colds in the head.

J. W. Bouton sends us the Illustrated Catalogue of the Salon of the Champs-Élysées, which opened on May Day. Secession has done nothing to diminish the bulk of the exhibition, but its quality cannot of course be safely inferred from these pictorial memoranda. We remark a pen-sketch by V. Parlaghy, after his portrait of Dr. Windthorst, which looks to be carefully enough done to have value as a likeness in itself. E. Renouf has made the Brooklyn Bridge his theme. The inevitable Jeanne d'Arc of this exhibition is found in the statuary department, and shows the Maid vowing herself to the salvation of France.

In the *Scottish Geographical Magazine* for May is the first of an important series of papers on "Britannic Confederation." This is by Sir John Colomb, M. P., and is devoted to a general survey of existing conditions. His main point is, that, under the present system, the colonies, which are practically independent except in their foreign relations, contribute absolutely nothing to the defence of the Empire. Formerly this was of little consequence, but, with the recent extraordinary growth of their commerce, it has become a question of the first importance as to whether this burden should not be divided. The present sea-trade of the United Kingdom is estimated at $744,000,000, that of the colonies at $460,000,000. But more than half of this, $273,000,000, is carried on with foreign countries, and in it the United Kingdom has no in-

terest whatever. This independent sea-borne trade "is increasing every year at such a rate as to be fast overtaking the sea-borne commerce of the United Kingdom itself." Attention is also called to the fact that "the provision made for imperial defence is very far indeed from keeping pace with imperial property requiring defence." A brief consideration is given to the disadvantages both to the mother country and to the colonies of absolute independence. The one would suffer from the insecurity of its food supplies and the raw materials for its factories; the colonies would be obliged to maintain each an army and a navy and to create a diplomatic service.

Dr. Pepper, Provost of the University of Pennsylvania, has notified the American Oriental Society that the University and the Babylonian Exploration Committee have resolved to open to students the inedited tablets, numbering 700 at present, which have been purchased by the Committee outside of Turkey and are now deposited in the museum of the University. In the meanwhile, Dr. John P. Peters, director of the explorations at Niffer, is negotiating at Constantinople with the Ottoman Imperial Museum respecting the products of these explorations.

The Marine Biological Laboratory at Wood's Holl, Massachusetts, will open its fourth season on July 8, limiting admissions to thirty persons, preferably teachers and others already qualified. There will be courses in zoology, botany, and microscopical technique. Applications should be addressed to Miss A. D. Phillips, Secretary, No. 23 Marlborough Street, Boston.

Mr. F. Gutekunst, Philadelphia, sends us an imperial panel portrait of ex-President Andrew D. White of Cornell, which, as a fine likeness and photograph, is worthy to rank with the Lowell and Curtis which we have already noticed in the same "gallery."

—In the *Economic Review* for April, Mr. C. J. Longman considers our new Copyright Act from an English point of view. He points out that authors whose works have failed to attract pirates hitherto will not be benefited by the act, since, if there had been a market for their works, the pirates would have found it out. But possibly there will be more inducement to legitimate publishers now that they are protected against the piratical propensities of their rivals. He further shows that new books by popular authors will have to compete with the piratical editions of their earlier works, and must therefore be issued at low prices. The protective features of the act are, of course, unfavorable to English printers and paper-makers, inasmuch as if a book is to be copyrighted in both England and America, it must be manufactured here, and the English export of copyrighted books will be stopped. But this, Mr. Longman says, has never been a large business, owing to the pirates, and he is of opinion that not "more than 5 per cent. of the books published in the United Kingdom after July, 1891, will be copyrighted in America." Upon the whole, he concludes, some English bookmakers, in the material sense, will suffer, while some authors will be benefited.

—In this connection we may notice 'The Question of Copyright,' prepared by Mr. Geo. Haven Putnam, and published by his firm in the "Questions of the Day" series. It is a perfect arsenal of facts and arguments, carefully elaborated and very effectively presented. Those who have received the impression that the matter of copyright has been settled by our recent act, are informed by Mr. Putnam that we have as yet only arrived at the point reached by France in 1810, and by Great Britain and the States of Germany in 1837. We are still behind most of the countries of Europe, the states of Tunis and Liberia, and the republic of Hayti. The book contains a summary of the more important of the copyright laws and international conventions now in force, and an abstract of certain measures likely to be enacted in England, and is lightened by a number of spirited essays by Mr. Brander Matthews and other writers, among whom Mr. Putnam is included. Altogether, it constitutes an extremely valuable history of the development of a very intricate right of property, and it is as interesting as it is valuable.

—No one genuinely interested in art can afford to ignore the question involved in the case of Prof. Herkomer's 'Idyl,' published in London and New York by Messrs. Novello & Co., which lately has been attracting so much attention in England, and, in fact, in the artistic world everywhere. When the book first appeared, Mr. Joseph Pennell, in the columns of the *National Observer*, asked Prof. Herkomer if all the plates in the book were etchings, as the publishers announced, and as the Professor himself, by his signature in each copy and on every so-called proof, guaranteed them to be. Those who have followed the recent development in the arts of illustration and reproduction need not be reminded to what a degree of perfection photo-engraving has been brought; that special method known as photogravure, when practised by a clever man, producing results which at the first glance can scarcely be distinguished from etchings, even by the most accomplished experts. Some little confusion has already followed. One or two unscrupulous publishers have advertised and sold photogravures as etchings, and critics and the public have calmly accepted the deception. Now, when the 'Idyl' was published there was good reason to believe that all the sixteen illustrations were not the etched plates they were claimed to be, and this despite Prof. Herkomer's signature. If a man holding his high position, a member of the Royal Academy and Slade Professor at Oxford, was allowed, unchallenged, to perpetrate such a fraud—it can be called nothing else—then there could be no doubt that the art of etching was doomed. Mr. Hamerton, Dr. Seymour Haden, Mr. Walter Sickert were three of many to record their strong disapproval of Prof. Herkomer's conduct and to demand an explanation. Several of the daily papers joined in their demand, and it was suggested that the Society of Painter Etchers, the Royal Academy, and the University of Oxford should take action in the matter. For six weeks Prof. Herkomer was silent. Then, in a letter to the *Times*, he admitted that nine of the sixteen plates were photogravures — that is, in plain language, that he had swindled every purchaser of the book who supposed that he was buying etchings and that Prof. Herkomer's signature was worth the paper it was written on.

—"All May Day demonstrations in London," writes a correspondent, "were postponed until Sunday, May 3, and then nothing could have been more orderly than the processions which were virtually all morning making their way to the Park, or the meetings which massed the people together in one uninterrupted line from Marble Arch to Hyde Park Corner. But any one who has watched the labor movement in London of late years must have been struck with two facts which distinguished this demonstration—one of the largest ever held—from any which have recently preceded it. The first was its genuineness. When the visitor from the West End to the St. Jude picture show or the People's Palace organ recital on Sunday wonders at the number of linen shirts and top hats in the crowd, he is assured that every workman always keeps a decent suit of clothes to wear on his one holiday in the week. But there were few white shirts or top hats among the demonstrators for an eight-hours' day. Here was the genuine workman — the docker, the porter, the sweated tailor, the stevedore, the factory hand—the man who supports himself and his family on eighteen shillings or a pound a week, and is thankful if he has a flannel shirt and a colored handkerchief to tie around his neck. Here, too, was the coster in his corduroys and buttons. Of course well-known politicians, faddists, and Socialists were on the platforms, but never have the working-classes turned out in greater numbers to claim what they believe to be their rights. The other feature of the afternoon was the very visible increase in the interest of the West End itself in the deputations from the East. Two or three years ago it was the exception to see a well-dressed person in the Park on such an occasion. But on the 3d there was a good-sized crowd of lookers-on whose social or industrial rank was as evident from their clothes as that of the assembled laborers and workmen. That something must come of this increased active interest on the one hand and growing curiosity on the other, would seem likely in any other country than England. But there, where demonstrations serve as safety-valves to the discontent of the masses, it is probable that the eight-hours' meeting will have as small consequences as the daily gatherings in Trafalgar Square of four years ago. However, it speaks well for all concerned that, despite the ill-feeling those gatherings inspired, the enormous crowds of the 3d met and disbanded their forces without the least disturbance or trouble, while the police were kept well in the background."

—The second volume of the 'Handwörterbuch der Staatswissenschaften' is brought to a conclusion in part xii., which contains 200 pages and comprises the whole of the letters C and D, while A occupied 1,046 pages and B 800. The apparent falling off in the space occupied is partly due to the fact that many large articles, such as Capital, Credit, etc., will appear under K, instead of C. The number of articles printed in this part is about 100, nearly equally divided between the two letters. As a natural consequence, none of the articles reach the great length of some printed in former instalments. The longest is one of 37 pages on National Domains or Public Lands; the next in point of length is one of 17 pages, by Prof. George Cohn of Heidelberg, on Checks, which, however, will strike American readers as unnecessarily long by reason of a somewhat pedantic discussion as to what constitutes or does not constitute a check. In general it may be said that, since Political Economy has fallen into the hands of professors, there is a tendency to invest with a great deal of complication matters which are intrinsically simple and capable of being explained in simple language. An article of 14 pages, by Prof. George Adler of the University of Freiburg gives an account of the Paris Commune of 1870–'71, with a bibliography covering a page and a half. Another article of the same length is that by Prof. Lexis of Göttingen (one of the editors of the Dictionary) on Bimetallism, in which the subject is treated in a moderate tone and with a degree of impartiality that almost smacks of Bunsbyism, but finally the conclusion is reached that Bimetallism

would probably lead to an exclusive silver standard. With the exception of an article of 11 pages on Discounts and Discounting, all of the other articles are short, none exceeding four pages. There is an unusually large number of biographical notices, the longest being one of three pages on Henry C. Carey, also by Prof. Lexis, and also measuring out substantial justice in very measured language. Other writers, more briefly noticed, are John Calvin, Carlyle, Thomas Chalmers, Cernuschi, Chevalier, Sir Josiah Child, Richard Cobden, Comte, Cossa, Dühring, etc. The bibliography is brought down very closely to date, the new French Dictionary of Political Economy, of which the first volume was completed in 1891, being cited as authority for biographies of French economists.

—The "telluric dry-gas lines" near D, mentioned in Prof. Piazzi Smyth's maps of 'The Visible Solar Spectrum in 1884,' are determined in a monograph on 'The Solar Spectrum at Medium and Low Altitudes,' from observations made at Lord Crawford's Observatory, Dun Echt, during 1887-89, by Dr. Ludwig Becker, and published in vol. xxxvi of the Transactions of the Royal Society, Edinburgh. The memoir contains a catalogue of more than 3,600 lines of the solar spectrum, including nearly a thousand telluric lines. The observations on which they are based exceed 26,000 in number, on forty-seven sunsets and thirty-two sunrises, and form a valued contribution to the literature of this complex study, from the point of view of both meteorologist and astronomer. Dr. Becker's instrument was in its optical part the great spectroscope of the Dun Echt Observatory, the necessary dispersion being obtained by a large Rowland grating, ruled on speculum metal with 14,438 lines to the inch, and presented to the Earl of Crawford by the Johns Hopkins University. This powerful apparatus Dr. Becker supplemented by an ingenious mechanism of his own devising, whereby the differential motion of the grating is suitably magnified, and at the same time recorded with rapidity and certainty on a continuous fillet of paper. As the observations have all to be made within a few minutes of sunrise or sunset, the means of instant and permanent record is an absolute essential. So successful was this novel mechanism that each line of the solar spectrum required on the average but nine seconds for determining its position. Dr. Becker's effective apparatus for doing this should have been figured as well as minutely described. Under the direction and at the charge of Lord Crawford, the whole was established on the top of the Barmekin, a commanding eminence a short way from the Dun Echt Observatory, rising 850 feet above sea level and distant fourteen miles from the coast. During the summers of 1887, 1888, and much of 1889, Dr. Becker spent all the nights on the hill. A great many of the telluric lines could be designated immediately, while others presented much difficulty. In a region where many telluric lines occur, there is, of course, a tendency to ascribe lines to atmospheric absorption which in other places would pass as solar. Much of the work had thus to be repeated several times for the avoidance of mistakes. With few exceptions all the telluric lines finally picked out were found to be arranged in three bands, the first of nearly 700 lines, and the other two of about 100 each. At the conclusion of his paper, Dr. Becker's brief comparison of his own work with the splendid charts of the late M. Thollon, made with a train of bisulphide-of-carbon prisms, and recently published from the Nice Observatory, proves the superiority of the Rowland grating beyond question.

JOHN DICKINSON'S CASE.—II.

The Life and Times of John Dickinson. 1732-1808. Prepared at the request of the Historical Society of Pennsylvania by Charles J. Stillé, LL.D. Philadelphia: J. B. Lippincott Co. 1891.

In spite of Thomas Jefferson's prediction, it seems to Dr. Stillé that something like a mildew has fallen on the brightness of Dickinson's fame in these latter days of the Republic. The biographer ascribes this result in part to the traditional indifference shown by Philadelphia to the reputation of her great men; in part to the dim eclipse which threw Dickinson's personality into shadow after his recoil from the Declaration of Independence, but most of all to the damaging impression made on historians by a series of articles published in Philadelphia under the signature of "Valerius" at the date of Dickinson's return to Pennsylvania in 1782, and consequent on his assumption of office as President of the State. In these letters of "Valerius," supposed to have been written by Gen. John Armstrong, afterwards Minister to France and Madison's Secretary of War, it was charged, with every variety of insult and opprobrium, that Dickinson had opposed the Declaration of Independence on general grounds of antipathy to popular liberty, because he was a monarchist at heart and an aristocrat by nature; that his persistent hostility to the new State Constitution of Pennsylvania was inspired by his subserviency to the Proprietary family and to the Tory interest; that he had deserted his military command in the open field in 1776, and in the presence of the enemy; that in the trying crisis of that hour he showed himself a physical coward as well as a moral traitor; and, finally, that he proved his traitorous intent by endeavoring, after his political defection, to destroy the credit and currency of the Continental money.

To all these charges and insinuations Dickinson made at the time a formal and elaborate reply, which Dr. Stillé reproduces in an appendix to his volume. The defence seems to have been ample in the judgment of Dickinson's contemporaries, at least so far as concerns the patriotism and integrity of the writer; and hence we find it difficult to concur with Dr. Stillé in the opinion that it is the venom of "Valerius" which has poisoned the fountains of history to the detriment of Dickinson's fame. The poison bottled up in these vials of wrath has long since evaporated and left no trace behind. Neither the railing accusation of "Valerius" nor Dickinson's reply has created the standing historical problem in this case. The problem results rather from the strange vicissitude witnessed in a high political career which exposed its subject to easy attack while he was living, and which imposed on him and on all who came after him the hard necessity of a difficult defence. How inert the operose invective of "Valerius" has become we may read even in Dr. Stillé's pages, for he has not thought it worth his while to give to "Valerius's" letters a careful study. He tells us that Dickinson made no reply to this torrent of denunciation "until the bitterness of his adversary had exhausted itself, so far as it could exhaust itself in the newspapers." In fact, "Valerius" continued to vent his spleen on Dickinson long after the latter had published his formal reply. In letters running from the 6th of November, 1782, to November 19, 1783, and perhaps later, he kept the sluices of his billingsgate perpetually in flow. In one of his closing letters he promised to give "a description which would reveal who he was," but he never kept his word.

We must look deeper, then, than in the mud and slime of the polemical politics of a former period for a solution of the enigma supposed to be hidden in the life, character, and career of John Dickinson. The *crux* of the riddle is found in the mystery that one who had waded so far and so bravely in the stormy waters of the Revolution should have returned so strangely on his steps, or should have stood still, at a time when returning or standing still was as little the part of personal prudence as of political foresight. He lived to confess the grievous fault he committed in shrinking from the Declaration of Independence, and the confession has served to vindicate the purity, the candor, the moral courage of his conduct; but it has not served to atone for the fault itself in the assize of impartial history. Whatever exceptions may be taken to some of the epithets with which Bancroft has characterized the action of Dickinson in certain emergencies, it seems to us that the general judgment of the historian of America must be pronounced no more than just. Dickinson, with all his beautiful virtues and scholarly qualities (may we not even say *because* of his beautiful virtues and scholarly qualities?) "was too delicately organized to take part in the rough work" of the Revolution. His refined culture and his opulent learning conspired with his delicacy, his modesty, his "timorousness" to make him over-confident of the power of rhetoric to untie a Gordian knot which only the sword could cut. It is not alone in the pages of later history that we find animadversion on his "nice refining and on the want of mastery over his erudition." His refinements often seemed intolerable to the most friendly of his contemporaries, and no one can read, for example, the paper which he prepared for the Provincial Meeting of Deputies assembled from the several counties of Pennsylvania in Philadelphia on the 15th of July, 1774, without seeing how just was the censure pronounced on his political pedantry. His polemical writings at this time are loaded down with a plethora of learned quotation until they may be said to resemble the cloak of Helen—*pallam signis auroque rigentem*, as Virgil has it. Each of the "Farmer's Letters" was carefully rounded off with an apt citation from the Latin tongue, as if even the signal of political conflict could best be sounded through the silver trumpet of the classics.

If we were set to discover the *mot* of the Dickinson enigma, we should hunt for it in the psychological study of a nature presumed to have been wanting in perfect symmetry and strength because of an unequal balance between its perceptive and its executive powers. Just in proportion as Dickinson's perceptive power was keen and wide, his executive power was liable to be stricken with paralysis by the lions he saw in his path without having the courage to take them by the throat. So it came to pass that he who reasoned in his cabinet "like an oracle of God," might be suddenly transformed on the field of action into another Aethelred the Unready. This psychological trait is no rare phenomenon in history, but finds expression alike in coarse natures and in fine spirits when they are called to face some dreadful moment in the Valley of Decision without having a force of will superior to their powers of perception. Men the most un

like in their moral character and in their social surroundings may resemble each other in this idiosyncrasy. Kinglake, the historian, has left us a striking picture of Napoleon III. on the eve of the Crimean War with which to illustrate the psychological weakness in question. Such would seem to be the portrait he draws of a man disposed to linger over-long in the early stages of a plot; who had the boldness which comes from reflection without that which comes from temperament; who nursed the idea of great enterprises without foreknowing what his sensations would be in the hour of trial; who was liable, therefore, at any moment to be scared by the very danger which he had long been courting, and who, with a procrastinating frame of mind, was always looking about when the hour of action came for some new resting-place in which to shelter his indecision.

It is no reflection on the patriotism of Dickinson that he had the defects of his qualities, and that, under the sway of his constitutional conservatism, he was unable to keep pace with the swinging gait of fervid spirits like Samuel and John Adams. He was conscious of his own limitations, even in the hour when he complained most bitterly of being deserted by his "unkind countrymen." A sense of joy at his release from an intolerable burden of public duty mingles itself even with these fruitless repinings of a wounded spirit. In letters written at the time, and especially in a passage which Dr. Stillé omits (perhaps from motives of delicacy), he tells Charles Thomson that no bridegroom ever entered the bridal chamber with more joy than that which he felt at the moment when he "cast off his popularity" and went into voluntary exile. He was glad to escape from the agony of civil feud, as Falkland was glad to die at Newbury, "ingeminating 'Peace! Peace!'" because he saw there was no peace for him this side of the grave.

"My books and my fields," wrote Dickinson in 1776, "are intercourse and employment for which my constitution is better formed than for the toils of war." His whole career is in keeping with this bit of self-analysis. Early in his public life he acknowledged that he had a disposition to look on the dark side of political changes, and confessed a willingness to submit with complacency to the "censure of being too apprehensive" where possible injury might befall his countrymen. Doubtless he never overcame this constitutional timidity, but it is pleasing to know that in the last great appeal which he made to his fellow-citizens—in the papers written to advocate the ratification of the Constitution—he pointed a pregnant moral against the credence too easily given to "prophets of evil." At the close of those letters he held up to derision the dire predictions adventured by the Earl of Belhaven when decrying the union of Scotland with England. Dickinson had seen the fallacy of such evil auguries in his own painful experience, when, inspired by a want of faith in the logic of events, he set his face against the Declaration of Independence for fear of the evils that were to come on the earth.

We can but admire the biographical enthusiasm with which Dr. Stillé carries his hero on his shoulders through all the fires of the Revolutionary ordeal, but we could sometimes wish that the author had been a little more strict in point of statement, reference, and date. After describing, for instance, the Proprietary Assembly in 1776 as a "bewildered," "puzzled," and "panic-stricken" body, which perished from pure inanition at the first touch of popular violence, it seems hardly consistent to speak of its "masterly inactivity," when its whole inactivity was really the mark and sign of a helpless impotence. It is stated that Joseph Fox, Speaker of the Pennsylvania Assembly, was a "colleague" of Dickinson in the Stamp-Act Congress. Fox was appointed a delegate but did not attend. The date of the Stamp-Act Congress, "the Morning Star of the Revolution," is fixed (p. 72) at the "5th of October, 1764," instead of the "7th of October, 1765." The cross-reference of Appendix vii (p. 421) is confounded with the cross-reference of Appendix iv, and should be p. 232 instead of p. 161. But most confusing of all is the reference made on p. 73 of this biography to Appendix i. as containing Dickinson's "original draft" of the resolutions submitted by him to the Stamp-Act Congress. On turning to the Appendix we find that the author has inadvertently substituted for that draft the copy of an entirely different series prepared *in pari materiâ* for the Provincial Assembly of Pennsylvania. Readers who wish to get access to the true *pièce justificative* may easily find it in the edition of Dickinson's writings published in 1801; but it is not pleasant in a work of history to be put on a false scent.

JAMESON'S STORY OF THE REAR COLUMN.

The Story of the Rear Column of the Emin Pasha Relief Expedition. By the late James S. Jameson, naturalist to the expedition. Edited by Mrs. James S. Jameson. Illustrated by C. Whymper from the author's original sketches. Authorized edition. United States Book Company. 8vo, pp. xxxii, 455.

THERE is much that is interesting in this book, regarded simply as a naturalist's account of his life upon the Congo, and no one can read it without a feeling of regret at the author's untimely death, as a distinct loss to science. Mr. Jameson began his short career as a collector, especially of birds and insects, at the age of twenty-one in Borneo, where he made at least one important discovery. This adventurous trip was followed during the next few years by extensive journeys in South Africa, the Rocky Mountains, and Algeria, so that when he joined Mr. Stanley's expedition he was exceptionally well fitted to make collections of the Congo fauna. Although his official duties interfered seriously with his favorite pursuit, he eagerly availed himself of every opportunity, with very considerable success, as is shown by the lists, given in the appendix, of birds and insects sent by him to England.

His diary and letters show that he was an excellent observer and able to give a vivid impression of the scenery of the great river and the various incidents of the march and camp life. The last entry in his diary, made five days before his death, while running the gauntlet of hostile natives at night, is a fair specimen of his descriptive powers:

"Shot out of an open reach—fine clear night—into a dark, narrow channel, not more than forty yards wide. All at once it became lit up with dozens of fires on both sides, throwing a bright light back into the forest and across the water. We glided on without a sound from us but the zip-zip of the paddles, drums beating, horns blowing, shouts and cries on every side, the white loin-cloths of our men showing plainly who they were. Down this lane of fires and noise we went for nearly half a mile, when suddenly it opened out into a grand open reach of the river on our right, the fires, drums, etc., going on for more than a mile away down on our left."

He seems to have had little inclination to note facts concerning the bird and insect life about him, and passages like the following, descriptive of the nest-building of the black weaver-bird, are accordingly rare:

"They tear a long thin slip off a palm leaf, hold it tight to the side of the nest with one foot, take hold of the loose end in the beak, push it through a small hole in the side, pull it out through another, and make it fast, using the unemployed foot as well as the beak the whole time, regularly weaving the strip of leaf in and out in a wonderful manner."

Still fewer are Mr. Jameson's observations on the distinctive habits and customs of the people with whom he spent seventeen months. Among these is a native's account of the manner in which they make poison for their arrows, which were "long thin slips of hardwood, not much thicker than a match." The ingredients are obtained partly from a tree and mixed "with snake poison, as well as with portions of the body of a child which had been dead a long time, heating it all up together in a pot." An interesting account is given of Tippu-Tib, who, while at first apparently doing everything in his power short of actual violence to wreck the rear-guard, was personally very kind to its officers. This noted freebooter has three nicknames, Tippu-Tib from the sound of his guns; "Mkangwa Nzala, 'afraid of hunger,' in reference to an old saying of his that he does not mind a road where there is plenty of fighting, for there there is food, but a road without fighting means hunger; and lastly, Mtipoora, 'footsteps' or 'footmarks.' When natives come to a village which he has attacked, they look at the footmarks, and say, 'Tippu-Tib has been here, it is a bad place, we will leave it!' This latter name, Mtipoora, is the one by which he is generally spoken of all over the country." From his conversations with Mr. Jameson this Arab appears to have far-reaching plans for greatly extending the territory over which he rules. He questioned him "very closely about all the parts of Africa where gold is found," possibly with reference to an expedition of a thousand men which he was then fitting out for a "gold country" south of Lake Bangweolo.

The main object of the book, however, is to tell the story of the rear column, and this it does, so far as Mr. Jameson is concerned, very simply and fully. How far it succeeds in rebutting Mr. Stanley's charge that "the rear column was wrecked by the irresolution, the neglect of promises, and the indifference to written orders of the officers he left in command of it," will probably ever remain an open question. But the diary leaves the reader in no doubt as to the spirit which Mr. Jameson brought to his duties. At the very outset he records his keen disappointment that Mr. Stanley's imperative haste to bring relief to Emin Pasha would absolutely prevent his collecting while on the march, his one object for joining the expedition. "Though I must say I was rather mad at first, I am now making the best of a bad business," is his comment, but with little success, for at the end of five months he writes to his brother, "As regards myself, the whole trip has been a vast sell." Unfriendly relations with his leader were under these circumstances inevitable, and it does not surprise us to find several incidents recorded in which Mr. Stanley is represented in the blackest colors as grossly unfair and ungentlemanly. When we find, however, that the missionaries of the Congo are accused of theft, treachery, and, by implication, of immorality, the absolute truth of Mr. Jameson's statements may justly be doubted.

It is evident, also, that he had no true interest in the men under his care. He notes in his journal their sufferings and death, with

now and then a kindly expression of regret that he is unable to help them; but we fail to recall a single instance of any attempt on his part to find out and relieve the cause of the great mortality among them. He is wholly absorbed, while in camp, with collecting, sketching, preparing his specimens, and cleaning his guns. His principal official duties seem to have been going the round of the sentries at night and flogging, or causing to be flogged, those whom he found asleep at their posts.

Mr. Stanley, in his letter of instructions to the officers of the rear column, gives some recommendations as to establishing, by gifts, etc., amicable relations with the natives who have been driven away by the expedition from some of their villages and manioc fields. He has not been gone a fortnight when Mr. Jameson suggests the capture of women in order to force the natives to bring in meat, not for the expedition, but for Maj. Barttelot and himself. This is the way in which he begins an account of the manner in which he carried out his barbarous suggestion: "July 10th—I had a most delightful day, for instead of digging the ditch I was out all day. I had determined to begin collecting to-day in the natural-history line, and succeeded in a much larger way than I intended, by collecting two native women, one baby, and a boy." Ten goats, twenty chickens, and some honey are demanded as a ransom. These the natives do not bring, because, as it turns out, they have but a single kid in their village. But Maj. Barttelot tells them, four days after the capture, that if they did not bring a boy whom they had taken prisoner in retaliation, five goats and twenty fowls, "the women would cease to exist." This threat, Mr. Jameson informs us, the poor creatures fully believed would be carried out. It may be said, in this connection, that the diary also gives an instance of Maj. Barttelot's manner of punishing offences. A Sudanese soldier stole some meat on December 2, receives 150 strokes, "which cut him up very much," is put in chains "doing walking punishment [carrying a load in camp] every day" until February 4, when he escapes. A few days after, he is recaptured and is shot, which, considering "from what a miserable existence he tried to escape," was, after all, a merciful act.

Mr. Jameson shows his heartlessness towards the natives in other ways, also. He, most inexcusably, shoots some of them while they are defending themselves against his companions, a band of Arab slave-hunters who have looted and destroyed their villages. It is difficult, indeed, to detect any difference between the way in which the two officers regarded the negroes and that of the Arabs themselves. "Three of Barttelot's slaves [women] escaped from the Sudanese soldiers in charge of them," is a terribly significant entry in the diary. The cannibal feast of which he is the witness is the most flagrant proof, however; his own account seeming to us to be cold-blooded, and to show only the faintest conception of the enormity of his folly, to call it by no harsher name. It is scarcely necessary to add that this treatment, instead of establishing amicable relations with the natives, alienated them so that the villages in the neighborhood of the camp were abandoned. This greatly increased the difficulty of getting proper food for the men, the want of which was the principal cause of their wretched condition.

Indifference to the welfare of his men, and inhuman conduct towards the natives, are the gravest charges which can be brought against the unfortunate Mr. Jameson. But his diary also shows that in many respects he did his duty, as he understood it, faithfully, and, in the latter days, zealously. He stuck manfully to his post through the weary months of inactive waiting, though under great temptations to relinquish it. In his bitter disappointment at the beginning regarding the expedition as a "vast sell," he ends by being willing to sacrifice his whole fortune to insure its success. His faults were those of a somewhat immature young man (he was but thirty-two when he died), which he would probably have outgrown under a more favorable influence than that of Maj. Barttelot. He was placed in a position for which he was unfitted and given a task too great for his powers. It is greatly to be regretted that Mr. Stanley was not generous and self-forgetful enough to have joined with his censure of Mr. Jameson the praise which in some respects he seems to have well deserved.

The volume is profusely illustrated, mostly from sketches by the author. There is also an appendix containing, among other things, a short account of his work as a naturalist by Mr. R. Bowdler Sharpe, and descriptive lists of his collections.

Noto: An Unexplored Corner of Japan. By Percival Lowell. Boston: Houghton, Mifflin & Co. 1891.

On the west coast of Hondo, the main island of Japan, facing Corea, and projecting northward above the thirty-seventh parallel of latitude, is the mountainous peninsula and province of Noto. Formerly an appanage of the powerful Baron of Kaga, richest of all the daimios, it has been, since the old provinces were practically blotted from the map by the new prefectures, a part of the Ishikawa *ken*. In the days of the Jesuit missionary operations in the seventeenth century, Noto was far from being "an unexplored corner," for it was again and again traversed by the Portuguese priests ministering to their little congregations of Christian believers scattered here and there. In the history of the Roman Catholic Church in Japan, Noto figures frequently upon the page as a hopeful portion of the field of faith.

It was not, however, a search into archæology that prompted Mr. Lowell to mount his jin-riki-sha, and, with his boy Yejiro and a supply of tinned provisions, to make such a flying exploration as the limited time fixed in his passport would allow. For much the same reason that Coleridge selected the Susquehanna River as the site of his proposed colony—for its euphony and mystery—did Mr. Lowell select Noto. "Nobody seemed to know much about my inamorata." "I liked its vowel color; I liked its consonant form, the liquid *n* and the decisive *t*." The letters "suggested both womanliness and will." The more he looked the more he longed.

This delightful initial page or two about nothing is the keynote of the book. The strain is prolonged, the linked sweetness is drawn out, to the two hundred and sixty-first and final page. It makes little difference to the author or reader where he went, or whether Noto was objective reality or a promontory in dreamland. On every page we have an exhibition of intellectual acrobatics. The quips and leaps, the ups and downs, frolic and play of mental gymnastics remind us of Hokusai's inimitable sketch of Japanese boys exhausting the resources of calisthenic fun on a bamboo. The Chinese characters which the Japanese have for centuries employed to express the aboriginal Aino name Noto, mean a drama of ascents. This was Mr. Lowell's journey, and in his literary presentation there is dramatic power, with the narration of not a little comedy. It is a book to be read for intellectual pleasure rather than for information. Partly by railway, partly by jin-riki-sha, he crossed the great plain, the mountain ranges, the dangerous passes, the Etchiu delta, by sea inland and beyond land, and saw what there was to be beheld in Noto, which by his own confession was little beyond, if not indeed somewhat less, than could be seen in other parts of Japan. This, however, will not disappoint the reader who seeks amusement rather than statistics. Mr. Lowell loses no opportunity for fun, or for comical reference to his classics and mathematics. His sprightly gayety of mind makes his chat about charcoal, bedquilts, rice-straw sandals, ferryboats, or what not, as interesting as if he were solving the problems of feudalism, or telling amazing rather than quite ordinary stories of personal adventure. He writes of the pilgrims, the family worship, the hotel life, and, in general, of the country and people in an unconventional style that will please the general reader. To those who from a traveller seek fresh stimulus or knowledge the wonder will be, with so much dessert, where is the dinner?

Charles Darwin, his Life and Work. By Charles Frederick Holder. [Leaders in Science.] G. P. Putnam's Sons. 1891. 8vo, pp. xvi., 279. Illustrated.

This biography has been written with a view to interest young as well as adult readers. The author has not attempted an analysis of Darwin's work from a professional standpoint, but has aimed to present as simply as possible the story of his life, with a plain statement of what constitutes that complex of scientific opinion which has been called Darwinism. The Life as a whole is derived from the standard sources, the 'Life and Letters of Darwin,' by his son, and the 'Voyage of the *Beagle*.' To these are added an enumeration of the scientific honors, medals, memberships, etc., which came to the great naturalist; some account of his ancestry and family, a chapter or two on "Darwinism," a reprint of the proceedings of the Darwin memorial meeting held by the Biological Society of Washington shortly after his death, a bibliography of Darwiniana, and an index. There are also numerous, mostly very good, illustrations.

The book is not remarkable, either on the literary or the scientific side, but meets very fairly the need for a cheap, popular life of Darwin, which should be available for readers in general and especially for the young. As a guide in science or a serious study of the subject, it is, of course, without pretensions. There are occasional unimportant slips in matters of natural history which we do not feel inclined to insist upon, but there is one statement to which serious exception must be taken. The author says: "He [Darwin] was in theory an agnostic, in practice an orthodox Christian of the broadest type" (p. 148). Darwin was a noble example of ethical perfection, but that he was a Christian, much less an orthodox Christian, in any legitimate sense of the term, cannot be truthfully asserted.

George Eliot, Matthew Arnold, Browning, Newman Essays and Reviews from the *Athenæum*. By Joseph Jacobs. London: David Nutt; New York: Charles Scribner's Sons. 1891.

This small volume contains the literary estimates of the four authors named on the title-page, which appeared in the *Athenæum* on the

occasion of their death; and together with them are six reviews of books by or about these authors. The estimates, it need hardly be said, are sufficient for the purpose they served; and if they are rather from a philosophic than a literary mind, and show more of German than of other culture, this is frankly declared by the author when he styles his criticism psychological and not æsthetic. The best of them is upon George Eliot, and embodies an admirably brief judgment; but we were more interested in the few remarks in the introduction upon the causes of the decline of her reputation since her death than in the analysis of her genius and influence. Mr. Jacobs looks upon her work as dominated by her ideas of Darwinism, or what used to be called such. He quotes his remark, made in 1879, upon the risk her works ran "by subordinating the eternal truths of art to what may be the temporary opinions of science," and adds that he was a true prophet. Darwinism, he thinks, "has come, and has conquered, and, as a vital influence in the spiritual life, has gone"; and "George Eliot, the literary voice of Darwinism," has fallen into some discredit with the theory that did not solve so many problems as it was expected to. There may be some truth in this, but it is surely a very narrow view, both of the permanence of the moral effects of the evolutionary conception of life, and also of the causes operant in that sort of decline in reputation which is implied in a change of popular reading. In this particular (and in other parts of these articles) the scientific habit of thought shows itself not best adapted to reach those conclusions, at once catholic and exact, which belong to literature in criticism; and, in general, the further Mr. Jacobs gets from the literary points of his subject, and the nearer he comes to the questions of "tendency," of social meaning, of analysis of mental faculty on the side of thought rather than expression, the better he writes. "Psychological" criticism betrays itself in the diction of a sentence like this, which occurs in the paper on Browning: "He attempted not only to give the emotive iridescence of the poetic afflatus, but also at the same time to suggest the accompanying inrush of clustering thoughts." The hand of a man of letters could not write like that, nor would good taste permit such an expression, we think, as this which closes the papers upon George Eliot: "The novelist's art has never been made so sacramental as by George Eliot."

The two extremes of defect in this volume, which calls for no special notice, are illustrated by these quotations—the excess of the scientific spirit and a certain lack of fineness in literary sensibility. These defects, however, do not prevent the notices from being valuable—they are, indeed, alike sound and reasonable within necessary narrow limits; but we cannot add that the reviews tagged on them were really worth reprinting, for the best points in them had already been used for the main article. So small a volume does not bear much repetition of thought and expression.

Introduction to Phonetics. By Laura Soames. London: Swan Sonnenschein.

We have here a book well calculated to make an important science more popular than it has been hitherto. While following, in general, the best authorities, Miss Soames has adapted her style and the arrangement of her material to the intelligence of the average reader; and the numerous word-lists scattered through the volume ought to be as helpful to the beginner as they are interesting to the more advanced student. Considering how little is really known, as yet, about the nature of speech-sounds, we think that the author is quite right in adopting the simplest possible classification, rejecting all obscure and uncertain distinctions. We have some doubts as to the propriety of calling French *o* in *homme* a "back vowel," but in so defining it the author merely follows Passy. In the nomenclature of consonants it would surely have been better to discard the terms "hard" and "soft"; the designation of English *r* as a "trill" looks like cruel sarcasm. Pitch is treated in a somewhat less modern fashion than the other branches of the subject, the authority cited being Trautmann, whose theories seem rather antiquated in the light of Lloyd's recent discoveries.

Nearly half of the book is devoted to the discussion of English; French and German sounds are then briefly described in accordance with the views of Passy and Vietor; the last eighty pages contain exercises and reading lessons. The English pronunciation adopted is nearly that of Sweet's 'Elementarbuch.' Words like *ask* have the "broad" *ah; o* in *bore, court*, etc., is always *aw; loss, soft*, etc., usually have *aw*, but the accented vowel of *halter, palfry, salt, want* is *ŏ; daunt, haunt* are *dawnt, hawnt*, but elsewhere *au* has, in such words, the value *ah;* "*r* is never heard unless a vowel follows it." *Wednesday* is given with the first *d* silent; Sweet's pronunciation is *Wednzdy*. We are grieved to learn that English children of the "middle and lower classes" accent the first syllable of *papa* and *mamma*. The form *ĭdyl*, which is quoted as a mispronunciation common "in the speech of educated people," explains a puzzling rhyme in Gilbert's libretto to "Patience." As was to be expected, many words appear in shapes that are but little known in our country; such are *princess* and *wayside* with the accent on the last syllable, and *plait* pronounced *plat*. The list of "faults characteristic of teachers, that is to say, pedantic efforts to pronounce as we spell," is a most welcome contribution, and might easily have been extended to ten times its present length.

BOOKS OF THE WEEK.

Adams, W. I. L. The Photographic Instructor. New ed. The Scovill & Adams Co. $1.
Allen, J. L. Flute and Violin, and Other Kentucky Tales and Romances. Harper & Bros.
Appletons' Dictionary of New York and its Vicinity. 13th year. D. Appleton & Co.
Bacon, T. S. It Is Written. Wilbur B. Ketcham.
Baker, J. John Westacott: A Novel. New ed. London: Sampson Low & Co.
Barr, Amelia E. She Loved a Sailor. Dodd, Mead & Co. $1.25.
Bates, A. A Book o' Nine Tales. Boston: Roberts Bros. $1.
Baxley, T. R. Songs of the Spirit. Buffalo: Charles Wells Moulton.
Bell, Mrs. H. Chamber Comedies. Longmans, Green & Co. $2.
Biography of Dio Lewis, A.M., M.D. Fowler & Wells.
Bonney, Rev. T. G. Old Truths in Modern Lights. London: Percival & Co.; New York: James Pott & Co.
Boutmy, E. The English Constitution. Macmillan & Co. $1.75.
Bréhat, A. de. Bras d'Acier; or, On the Goldpath in '49. Cassell Publishing Co. 50 cents.
Briggs, Prof. C. A. The Authority of Holy Scripture. 2d ed. Charles Scribner's Sons. 50 cents.
Brooks, W. The Oyster. Baltimore: Johns Hopkins Press.
Crosby, Margaret. A Violin Obligato, and Other Stories. Boston: Roberts Bros. $1.
Combe, T. A Question of Love. Boston: Roberts Bros. $1.
Conkling's Handy Manual of Useful Information. Chicago: Laird & Lee. 25 cents.
Cyclopædia of Temperance and Prohibition. Funk & Wagnalls. $3.50.
Directory of Second-Hand Booksellers and List of Public Libraries. Rochdale, Eng.: James Clegg.
Eight Days. United States Book Co. 50 cents.
Fairchild, Dr. M. Augusta. Women and Health. Quincy, Ill. $2.50.
Fiske, A. K. Beyond the Bourne. Fords, Howard & Hulbert.
Fiske, J. The American Revolution. 2 vols. Boston: Houghton, Mifflin & Co. $4.
Flower, W. H., and R. Lydecker. Introduction to the Study of Mammals, Living and Extinct. Macmillan & Co. $6.
Furniss, Grace L. A Box of Monkeys. Harper & Bros.
Goncourt, E. and J. de. Germinie Lacerteux. Belford Co. 50 cents.
Goncourt, E. and J. de. Mademoiselle Renée Mauperin. Belford Co. 50 cents.
Grant, J. B. Our Common Birds and How to Know Them. Charles Scribner's Sons. $1.50.
Green, T. M. The Spanish Conspiracy: A Review of Early Spanish Movements in the Southwest. Cincinnati: Robert Clarke & Co. $2.
Grey, M. In the Heart of the Storm. D. Appleton & Co. Also, United States Book Co. 50 cents.
Gunsaulus, F. W. Monk and Knight. 2 vols. Chicago: A. C. McClurg & Co. $2.50.
Halliburton, Dr. W. D. A Text-Book of Chemical Physiology and Pathology. Longmans, Green & Co. $9.75.
Hancock, Anson N. The Genius of Galilee. Chicago: Charles H. Kerr & Co.
Hans Andersen's Stories. In two Parts. Boston: Houghton, Mifflin & Co. 30 cents.
Harland, Marion. At Last. G. W. Dillingham.
Harrison, Mrs. B. The Anglomaniacs. Cassell Publishing Co.
Harris, J. C. Balaam and his Master, and Other Sketches and Stories. Boston: Houghton, Mifflin & Co. $1.25.
Hobson, J. A. Problems of Poverty. Methuen & Co.
Howells, W. D. Criticism and Fiction. Harper & Bros.
Howe, F. H. In Spite of Himself. Belford Co. 50 cents.
Huntington, Rev. W. R. The Peace of the Church. Charles Scribner's Sons. $1.25.
Hutchinson, H. G. Famous Golf Links. Longmans, Green & Co. $2.
Idle Time Tales, by F. Coppée, Balzac, etc. Chicago: Rand, McNally & Co.
King, Capt. C. By Land and Sea. Philadelphia: L. R. Hamersley & Co.

The Nation.

NEW YORK, THURSDAY, MAY 28, 1891.

The Week.

It is not likely that the managers of either of the great political parties will give much serious thought henceforth to the "People's Party," which was formally organized in Cincinnati on Thursday of last week. Probably the strongest impression which the gathering has made upon professional political observers has been one of surprise that the various new party movements in the West and South were able to make no better showing in a national convention. The roll-call of the Convention by States showed that only 32 of the 44 States were represented, and that of the 1,418 delegates present, nearly a third, 411, were from Kansas, and nearly a fourth, 317, were from Ohio. The combined representatives from Kansas, Illinois, Wisconsin, Nebraska, Ohio, Indiana, Iowa, and Minnesota, numbered 1,147, leaving only 271 for all the remainder of the country, so that it was really a convention of the dissatisfied and discontented elements of the population of eight Western States, all except one of which, Indiana, have hitherto been considered safely Republican in Presidential elections. Only ten Southern States were represented at all, and of their 113 delegates, 59 were from Kentucky, 26 from Texas, and 13 from West Virginia, making 98 from three States, and leaving only 15 to be divided among the remaining seven. If either party can find any cause for uneasiness here it is the Republican, but there is much less to disturb Republican calculations than many observers have supposed. No new leaders were brought to the front in the convention, but the two moving spirits were Ignatius Donnelly of Minnesota and Gen. Weaver of Iowa, both conspicuous in the Greenback and other cheap-money campaigns of the past, and both as thoroughly discredited "leaders" as could be found in the whole country. Weaver, it will be remembered by students of political almanacs, was the Greenback candidate for the Presidency in 1880, polling in the whole country 307,740 votes. He did not seriously menace the fortunes of either party in that campaign, and there is little reason to regard him as more of a "power" now, with his old ally, Donnelly, and his new ally, Peffer of Kansas, than he was then.

The declaration of principles put forward by the Convention is no more original and captivating than its leading spirits. It is the old Greenback platform, with modifications and variations to suit the latest developments of the cheap-money mania. It calls for "plenty of money in the pockets of the people," with no limitation either as to amount or quality. It endorses the absurd sub-treasury scheme in the advocacy of which even such strong defenders of the "people's interests" as "Jerry" Simpson are beginning to falter. There is no more popular magnetism in this familiar demand for more money for everybody, and in this cry for "death to the money power," now than there was when Gen. Weaver ran for the Presidency with them as "battle-cries" in 1880, or when Gen. Butler, assisted by the New York *Sun*, ran with them in 1884, and polled only a little more than half as many votes as Weaver had received. Every issue which represented a definite following was left out of the platform. There is no mention of the tariff in it, and no allusion to the prohibition question, two subjects upon which convictions of some kind would have appealed to large bodies of voters.

There was an interesting discussion of the immigration problem at last week's session of the Conference of Charities and Correction in Indianapolis. It was introduced by a report of the Committee on the subject prepared by S. C. Wrightington of the Massachusetts Board of Lunacy and Charity. This report took ground in favor of severe restrictions upon immigration in future, and laid stress upon the falling off in the character of foreigners who have come to this country of late years, physically, intellectually, and morally, as compared with earlier periods in our history. This opinion, however, was stoutly contested by Mr. Cadwalader Biddle of Philadelphia, who is connected with the Pennsylvania Board of Charities. He declared that the immigrants arriving at Philadelphia now are of a better class than those who came a few years ago, and maintained that the cost of the paupers and other defective classes coming from abroad is not so great as has been estimated, as charitable institutions must be built and sustained for the native population. Mr. A. O. Wright of Wisconsin said that his State had the largest foreign population of any in the Union—two-thirds of those over twenty-one years of age being of foreign birth. That population is German, Scandinavian, Irish, etc., but they furnish no more crime, pauperism, and insanity than do the natives. They are good citizens and are a valuable population. Some of the counties are wholly settled by these people, and although they are opposed to prohibition, he, as a temperance man, was forced to admit that drunkenness is no greater in such counties than in those where prohibition is favored by a majority. A Colorado delegate enlarged upon the evils of the contract-labor system, and declared that it was not consistent for the Union League Club, whose members, as members of corporations, had caused such laborers to be brought to this country by tens of thousands, now to deplore the evils of unrestricted immigration. Herbert A. Forrest of Michigan, himself a native of a foreign country, told of a colony from Europe which occupies an entire township in Michigan. The township is one of the richest in the State, he said; there is never a dollar of delinquent tax against it; it has not a pauper or a drunkard; yet none of the people use the English language, and they could not have got consular certificates because they were fleeing from a tyrannous government which would not have let them come to America.

There was no approach to agreement as to the proper methods of restriction among those who believed that something ought to be done. Several speakers advocated some form of supervision by our consuls in foreign countries. But Mr. Everett of Washington, who was connected with the American Legation at Berlin for seven years, pointed out many difficulties in the way of such supervision, and did not think the plan feasible. Father Bessonies of Indianapolis took the same view. The people, he said, flock into the towns where they are to embark, by thousands, from distant places, and the consuls could not know or find out their character or fitness for emigration. He thought that if there were Government agents at the ports of entry in this country to direct the immigrants where to go and how to reach places where they are needed, much pauperism and crime would be averted. The discussion only served to show the wide divergencies of opinion as to the seriousness of the evil among those who have studied the subject, and the utter lack of agreement as to how to overcome the evil among those who are most impressed with its seriousness.

The President of the American Screw Company has made in the Providence *Telegram* a remarkable statement concerning the effect of the drawback provisions of the McKinley tariff law. This company, which ranks as the first of its kind in this country, has been forced by the onerous conditions of the drawback provisions to establish a branch manufactory at Leeds, England, and proposes to establish another branch in Germany, in order to supply the foreign demand for its goods. "We shall," says the President, "introduce the American system of work into our Leeds factory, with Americans for the heads of the various departments, but with English factory hands." This is the way in which the McKinley tariff helps American labor, and protects it from the "ruinous competition of the pauper labor of Europe." This decision of the American Screw Company furnishes a practical demonstration of the truth of the statements which Mr. David A. Wells made in the *Evening Post* of April 20 concerning the worthlessness of the drawback provisions, and shows that President Harrison and Mr. McKinley, in asserting to the contrary, evidently did not know what they were talking about.

It will be remembered that McKinley and his associates declared, when protest was made against more than doubling the tax on foreign tin, that the proposed new tax would not go into effect before July 1, 1891, and predicted that before that date American tin plate would be selling more cheaply than foreign, and that in the meantime there would be no advance in the price of foreign tin. July 1 is nearly here, and if there is any American tin plate in the market to be bought in quantity at any price, nobody has been able to find it. In the meantime the price of foreign tin has gone up so that the amount of the increased tax has to be paid to the foreign manufacturers, and the American workingman's tin dinner-pail costs him proportionately more than it did before the McKinley Bill became a law. The Buffalo manufacturer, like the American Screw Company, is, as we learn from the Buffalo *Courier*, forced, in order to do any export business, to build a factory in Canada, to be manned by Canadian labor, in order to compete with Canadian producers of dinner-pails on their own ground. In this way, the American manufacturer will be able to sell dinner-pails to Canadian workingmen at a lower price than he can sell them to American workingmen, and the latter will also be deprived of the wages which will be paid for the Canadian output. It will be observed that the Buffalo manufacturer, like the American Screw Company, finds the drawback provisions of the McKinley law of no use whatever.

The attempt to suppress the manufacture of oleomargarine by putting a tax upon it has proved an utter failure. The sales of stamps by the Internal-Revenue Bureau during the four years since the law was passed shows that the industry has grown, despite this attempt on the part of the Government to suppress it. The sales in 1886 aggregated $407,670; in 1887, $642,710; in 1888, $686,674; and in 1889, $624,499; while thus far, in the ten months of the fiscal year 1891, the aggregate of stamps sold is $694,944, or more than for the twelve months of any previous year. The fluctuations in the manufacture of oleomargarine are found to follow almost exactly those in the butter market. Thus, during the winter of 1889–90 butter was plentiful and cheap, and as a result the trade in oleomargarine declined heavily, while during the last few months butter has been scarce and high, and the sales of oleomargarine stamps have been very large—$137,513 during April, as against only $23,290 in July last.

There has seldom been a grosser abuse of the taxing power than in the act imposing a penalty upon the manufacture of this substitute for butter. Everybody concedes that the Government has a right, and, indeed, is bound, to see that such a substitute is not prejudicial to the public health; but the act in question imposed the tax without any reference to the quality of the product. There is no doubt that pure oleomargarine is healthful, and the Government has no more business to put a tax upon a pure substitute for butter than it would have to put such a tax upon butter itself. The act in question was simply a piece of "class legislation," such as the farmers are constantly denouncing, in the interest of those farmers who raise more butter than their families use, and who wanted to force people, many of whom were poor, to pay a higher price for it than they could charge without the interference of the Government. It was as unreasonable and unjust as many of the outbreaks against the introduction of labor-saving machinery, which have always wrought temporary harm to some element in the population at the same time that they brought permanent advantage to the whole community in the long run.

The Republican members of the Pennsylvania Senate have refused to allow a ballot-reform bill to be passed through that body at the present session by adhering to the preposterous measure which they had reported from committee. It is not a ballot-reform bill in any sense of the term, and is a direct contradiction of the bill which passed the lower house some weeks ago. The action of the Senate Republicans is in compliance with orders from Quay and the local Republican bosses, and so patient and long-suffering a Republican organ as the Philadelphia *Press* admits that, in taking the course they have, these Senators are seeking the defeat of all ballot-reform legislation. The *Press* says of them: "They don't even want the bill which they are passing themselves, and, as nobody else wants it, it had much better be defeated outright than passed in its present shape. It is a mockery of ballot reform and an insult to the intelligence of the people. Republican Senators who are supporting this abortion are doing their utmost to dishonor the Republican party." The idea of "dishonoring" a party which submits to Quay's leadership in all things must strike the Senators as a delightful joke.

While there has been a solid basis for the Southern prosperity which has of late years challenged the attention of the nation, unscrupulous speculators have made fortunes for themselves, and cheated thousands of people out of larger and smaller sums, by working up fictitious "booms" in one place and another. The collapse of some of these booms has been so complete as to be laughable to outsiders. Application was made the other day for the appointment of a receiver to take charge of the property of the Cardiff Coal and Iron Company in Cardiff, Tenn. A year ago this company published flaming advertisements of a forthcoming sale of lots in what it was declared would soon be one of the great manufacturing centres of the South, and over $900,000 worth of lots was sold. Purchasers were assured that the company had $1,000,000 in its treasury to spend in public improvements during the first year. The year has expired, and the town now consists of a $50,000 bank, a saloon, and a country store. The Judge granted the application, on the ground that the company was insolvent, was fraudulently disposing of property, and was granting fraudulent preferences.

No one who has followed the course of events in the Pension Bureau at Washington since it came under the control of the Harrison Administration can doubt that a portentous scandal has been in preparation there from the moment of "Corp." Tanner's entry into the Commissionership. Gen. Raum took hold of the work at the place where Tanner was forced to drop it, and he is greatly misunderstood if he has not exceeded Tanner in many ways as a sower of seed for a future crop of scandals. The conduct of his son was so bad that it is said that the Attorney-General has ordered the District Attorney to investigate it, but it will be surprising if the public is allowed to see much that the District Attorney discovers. Sooner or later there will have to be an investigation which will investigate to find out, and when it begins to work, the President will be convinced, perhaps, of the folly of trying to prevent scandal in a public office by removing one bad official as soon as he is found out, and putting another bad one in his place.

We expected that our exposure of the garbling done by somebody in Washington, in citing the case of Rose vs. Himely, in the *Tribune* the other day, would call forth something in the nature of excuse or defence, and we foresaw exactly what the defence would be, namely, that the decision in Rose vs. Himely was reversed in the case of Hudson vs. Guestier. But this is no defence at all. It fails to tell us how the decision of the court in the case of Hudson vs. Guestier justifies the production of an extract from a dissenting opinion in Rose vs. Himely as the decision of the court in the latter case. We knew that the decision was reversed in the case of Hudson vs. Guestier, but the young gentleman who gets up Secretary Tracy's authorities for him apparently did not, or he would have cited it in the first instance, instead of exposing himself to the charge of garbling by citing Rose vs. Himely. The only opinion it was permissible to him to quote from the case of Rose vs. Himely as the opinion of the court, was the opinion of Chief-Justice Marshall. The only other point in the defence worth notice is the quotation from Hall, justifying "pursuit into the open seas" of a vessel which has committed an infraction of municipal laws. Hall qualifies this in this way:

> "It might be added that this can only be done when the pursuit is begun while the vessel is still within the territorial waters, or has only just escaped from them. The reason for the permission seems to be that pursuit under these circumstances is a continuation of an act of jurisdiction which has been begun, or which, but for the accident of immediate escape, would have been begun, within the territory itself, and that it is necessary to permit it in order to enable the territorial jurisdiction to be efficiently exercised." (P. 214.)

But "the little Puffendorf" who gets up the

authorities for Secretary Tracy fails to see that this authority does him no good, because our pursuit of the *Itata* did not begin within the territorial waters. It began three days later, and was therefore open to the objections which Hall states on the same page. But if he will not garble or misstate again, we will forgive him this time. Error in opinion is venial, but wilful misquotation is a serious offence.

The attempt of some of the Standing Committees of the Episcopal dioceses to prevent the election of Phillips Brooks to the bishopric of Massachusetts, taken in connection with the attack on Dr. Briggs, seems to indicate that the unwillingness to give high places to eminent men, which has so long been a marked feature of our national politics, is making its way into the ecclesiastical forum also. In England, for a long time, the test of "availability" in candidates for bishoprics to be filled by the Crown has been very much the same as our test of availability for the Presidency. That is, the candidate, in order to have a good chance of nomination, had to be a man who had uttered no decided opinions, had given no offence to parties or sections of parties in theology, and was in all things, including eloquence and piety, remarkable only for avoiding extremes. This, of course, means that it was, as a rule, the obscure and "safe" men who got the bishoprics. But of late years there has been a strong disposition in England to abandon this policy and give the ecclesiastical prizes to men, like the late Archbishop Magee, famous for their eloquence, or their scholarship, or their courage and force of character. It would be very interesting if the American Church were to begin to show fear of talent and eloquence just as the English Church was getting over it, and to shudder and turn pale at the sight of heterodoxy just as the mother Church was beginning to handle it fearlessly and with enlightened curiosity. The chief end of a bishop, as of a church, is, after all, to convince men that the Christian religion furnishes a good rule of life, and in all ages it has been the able rather than the sound men who have been successful in this undertaking. Just now the Church's great difficulty is to get people to listen to the pulpit at all, so that there would be something almost comic in its absurdity in the rejection, as a candidate for a great place, of its most powerful and effective preacher, because some little men in various dioceses are not sure that they agree with him on various little points on which there never has been any general agreement at all.

What we said a few weeks ago was a fair inference as to the reason for existence of the reciprocity treaty with Brazil—namely, that it was a gift by the Provisional Government of that country in return for recognition by the United States—is now asserted to be a fact in a French newspaper published in Rio, the *Brésil Républicain*. The statement is that the treaty was made a condition *sine quâ non* by the Washington Administration at the time of recognizing Fonseca, and that this accounts for his putting it through in defiance of public opinion. However this may be, it is clear that the treaty does not gain in popularity in Brazil as the weeks pass by. Especially does the announcement of our proposed treaty with Spain and with other South American Republics make the Brazilians feel doubly foolish in having given away so much for nothing. If sugar from Cuba and Porto Rico, and hides and coffee from all South America, are to be given as favorable treatment as the corresponding products of Brazil, the agreement is too palpably one-sided. But Fonseca proposes to be a law unto himself in this matter and everything else. His recent reorganization of his Cabinet has had the curious result of turning out almost all the Republicans and putting inveterate monarchists in their places. His new Premier is Baron Lucena, who officially insists upon his title, in spite of the prohibition of titles of nobility in the new Constitution. He is said to be at present the dominating personality in Brazilian politics, and to be the man really behind Fonseca in the reactionary policy recently inaugurated. Governors of States have been arbitrarily removed, pending the election of State Legislatures, and other high-handed measures resorted to in order to get officials subservient to the Administration. No one supposes that a monarchist restoration is contemplated, but only that support is sought for the personal rule of the President.

The financial question seems likely now to be the pivot upon which the civil war in Chili would turn, and it would appear that the insurgents are in possession of the longest purses. Balmaceda's agent in London is reported to have met with no success in his effort to place a loan for so small a sum as $1,500,000. The President's message to Congress, April 20, was telegraphed in full to Europe, it is said at the author's private expense, in order that the flattering account he gave of the progress of the war might have its effect in bolstering up his failing credit with European bankers. In this it was a decided failure, since along with it went an official despatch from the heads of the Provisional Government at Iquique, setting forth the highly questionable legality of any such loan, and calling upon the representatives of the insurgents abroad to give public warning that no such loan would ever be recognized by the Congressional party in case of their final success. On the other hand, the insurrectionary leaders, either by good luck or foresight, early gained control over the great nitrate-producing provinces, and the large revenue thus put within their power has been generously added to by advances from wealthy Chilians. It is this situation of affairs that makes the "Nitrate King" of London believe in their ultimate triumph, and his opinion is certainly given color, just now, by the apparent cessation of serious fighting, and the settling down of the two parties to a contest of financial endurance.

The unexpected devotion of the Belgrade students to ex-Queen Natalie has turned a prearranged comedy into a deplorable tragedy. The expulsion of Natalie was virtually decreed by the Skupshtina several weeks ago, and the determination to carry it into effect was communicated to her by M. Patchitch, the Servian Premier, in a letter in which he "humbly begged her Majesty to be pleased to inform him of her decision." To this Natalie replied, after conferring with M. Garashanin and others of her advisers, that she did not consider the decision of the National Assembly as an order to leave the country, but merely as an expression of a wish; and that she was firmly resolved to remain in Servia, considering that her removal could not possibly be useful either to the interests of the kingdom or to those of the throne. "Should it, however," she added, "be my destiny to have to yield to force, I shall at least have proved to my only child, and perhaps later on to history, that I have left my son not of my own free will." It thus became clear that she had resolved to turn a deaf ear to the counsels of Count Hunyadi, a Hungarian nobleman related to the Obrenovitch family, who had gone to Belgrade to pursuade her to leave Servia of her own accord, without compelling the Regents to resort to force.

The enthusiasm with which Natalie was received at Semlin in Hungary, where she first sought refuge after leaving Servia, though not unnatural in view of her beauty and personal respectability, lends a further touch to the *bouffe* proceedings which have characterized her expulsion. For Natalie has all along been known as a pliant tool of Russia, and as such her doings were particularly obnoxious to the Government of Austria-Hungary. The statesmen of Vienna and Budapest are likely to take a more prosaic view of her martyrdom, and will adopt measures to prevent the Serbs of Bosnia, Herzegovina, and Croatia from becoming embroiled in the troubles of the kingdom of Servia. Whether Russia will now show her hands more plainly in the game to be played between the families of Obrenovitch and Kara-Georgevitch remains to be seen. Personally, there is little to choose between the two dynasties and their representatives, young Alexander of Servia and Peter Kara-Georgevitch. It is easy to imagine what the political and moral training of a boy must be who rules over a country which has ignominiously expelled both his father and his mother, after fraudulent divorce proceedings. Meanwhile, the wretched Milan, who promised to refrain from meddling in Servian politics on the payment of a million francs, appears on the scene in the character of a sage, shakes his wise head over the "unskilful management" of the expulsion, but inclines to the opinion that "there is no danger of a revolution in Servia." As for himself, he has "entirely abandoned politics."

MR. CARLISLE'S EASY LESSON.

THE *Sun* of Friday morning contained a very interesting and suggestive report of an interview between a delegation from the Cincinnati Convention and Senator Carlisle, whom they went to visit at his home in Kentucky. One of the first questions they asked him was, what he thought of their scheme of Government ownership of the railroads and telegraphs. This gave him a chance to inquire about the details, and he used it to great advantage. He asked how the Government was to get possession of them; was it to confiscate them? They acknowledged that this would be unfair, as they are now private property. He then showed that if the Government did not confiscate, it must buy, and that if it paid a fair price to the owners of the property, it would have to raise for the purpose $14,000,000,000, a sum over four times greater than the debt incurred in the prosecution of the late war, and would have to raise it by taxation.

"Are you ready," he said, "to tax yourselves to raise this money? Then, after you have got the property, are you ready to tax yourselves to operate it, for the Government never yet succeeded in doing business at a profit? Consider another effect: such a plan would add perhaps 1,200,000 men and women to the roll of Government employees. How would you ever succeed in turning out of power an administration with such resources at its command? The more corrupt it was, the more difficult it would be to displace it."

This proved a powerful aid to reflection, and brought about a thoughtful silence among the delegates on this branch of their subject. They then took up the well-known topic of the concentration of "the money power in too few hands." He met them on this point by asking how they were going to remedy this evil—by a revolution or by an act of legislature? "Do you propose to say by your legislature that when a man has earned $100 or $1,000 or $10,000 he shall not earn any more?" This again reduced them to silence. In fact, the whole incident more than justifies the suggestions we have often made in these columns as to the good effect of the Socratic method on the current economic delusions if applied to individuals in a private room. It is very difficult to reach the minds of those who are dominated by them through a newspaper article or a speech. Neither of these applies any real pressure to their minds. They let the argument slip by as something perhaps a little puzzling for the moment, but to which they will find an answer presently; but when face to face with an honest questioner who does not rouse their antagonism, and removed from the confusing influences of a great assemblage, they are compelled to dive at once into the recesses of their knowledge-box for an answer, or, in other words, to think the thing out.

Two great changes in the American popular feeling on economic topics Mr. Carlisle's questions forcibly bring home to us. One is the rapid inoculation of the masses, particularly in the West, with the European Continental idea of the Government as an earthly providence—a power separate from the people, and possessing resources of its own available for all sorts of philanthropic schemes. The growth of this idea in this country has been kept down until now, as regards the State and the towns, by the small scale on which they do their work and by the closeness of the taxpayer to the treasury. Every town meeting in New England, for instance, has been to every voter in the town an impressive reminder that the Government and the people are one, and that any man who puts his hand into the public treasury literally puts it into his own pocket. But as the Federal Government has grown in magnitude and power, the distance between it and the voter has increased; it has assumed more and more the appearance of a great being that can regulate industry, abolish poverty, and enrich the poor, and manufacture money by mere act or resolution without drawing on anybody for the expenses. The inclination of the native imagination to take this view has of course been greatly stimulated and aided by the foreign immigrants, who come over with it already in their heads. We know of no way of keeping it down or banishing it so efficacious as direct taxation, as it exists in towns, but this does not seem practicable. If the cost of such measures as the Pension Bill, and, indeed, of all bills not providing for the ordinary expenses of the Government, had to be provided by the direct application of the tax-gatherer, it would be the best kind of popular education. Next to it comes the cornering of craze leaders for private examination, and this can be practised to a greater or less extent.

If, too, the very simple arithmetical process of an imaginary division of the riches of the rich among the whole population were oftener performed, it could not but have a very illuminating effect. We think it would be found, could we get a peep into the brains of those who are most concerned about the concentration of "the money power in too few hands," that what fascinates each of them, in the prospect of a division of the funds of the Vanderbilts and Goulds and Rockefellers, is the notion that he will himself get a slice of the wealth that would make a permanent change in his condition. Were he shown more frequently the exceeding smallness of the dividend which the poor would receive through the distribution of the accumulated wealth of the world, there is hardly a doubt that he would give more of his attention to honest industry and less to political agitation. In no socialistic or semi-socialistic scheme is there any provision made for the accumulation of capital—that is, the saving from this year's products for future use. In our present social organization, this is the special function of the class known as capitalists. They save for the whole community, so that when it wants to do something besides growing food, it can find resources ready for the purpose. They are highly paid, we admit, but they are not more highly paid than is necessary to secure their services, for their peculiar talent is very scarce.

Another and hardly less important service which they render is finding out, by the experiment known as speculative investments, what the wants of the community really are, and into what sort of enterprises the public savings had therefore best be put. Hundreds are sacrificed in this work for the one who succeeds, but the fewer the number of those who succeed, the larger their remuneration has to be. To suppose that civilization could be carried on without this class, or that the class could be maintained if robbed every now and then by the Government, or if denied all enjoyment of its money in the shape of luxury and leisure and power, is one of the most absurd of the Socialist chimeras. Of Socialist expectations, too, none is queerer than that rich men should be extraordinarily virtuous, and ashamed of their success, and eager to share with everybody who can prove his poverty. They need restraint by law, just as the poor do, and as all power does in civilized commonwealths. But we may rely upon it that, as somebody said of the Jews, every nation has the kind of rich men it deserves. The poor in a democracy make the rich whatever they are.

SOME BLESSINGS OF INTOLERANCE.

RECENT events in the Presbyterian and Episcopal churches have given occasion to many to bewail threatened departures from that toleration which, historians tell us, it was the great work of the eighteenth century to have broadly and securely established. We are in danger of a "recrudescence of intolerance," we are told. Now, we shall not be accused of favoring the return of the Inquisition, but there are two sides to most questions; toleration has not all the advantages on its side, and intolerance is not without blessings even to those who are its victims. A hint at some of these may reveal some relieving aspects of the pending ecclesiastical controversies.

Certainly toleration tends to diminish men's ardor in the pursuit of the truth. If one opinion is as respectable as another, and all are uncertain, it seems as if the game were not worth the candle. Mr. Maurice, it is true, used to number among his paradoxical views the idea that the only reason and true ground of toleration is a thorough certainty that you are right, and altogether right, and that those who differ from you are wrong, and nothing but wrong. On those terms, he said, you may tolerate opponents; on those terms, and those alone, the Established Church may look upon Dissent with equanimity. But for the rest of the world it is pretty clear that the uncertainty, not the certainty, of truth is the excuse for tolerating different views of it. Parties and sects go on with their strenuous argumentation, of course; but, after all, it comes down to about this, in the end: "These are our views; we hold them with conviction, but if you don't, it's no great matter; we shall still look upon you as a man and a brother; go your way in peace, or, rather, come around to dinner, won't you?" Now, this patronizing toleration must take the edge off the zest which men once seem to have felt in the search for the truth. It discourages thinkers by making them feel that the world will not take them seriously any more. If they do discover

new truth, there is no way of forcing it, or even forcing attention to it, upon an unwilling or careless mind.

The truth is, intolerance furnishes a prime condition of propagating truth, and so an incentive to struggle to attain it, by offering an innovator a vigorous opposition, and making it possible to give the supreme testimony of suffering for conviction's sake. A New England clergyman has been heard to say, in sober earnest and with no little passion in his voice: "I wish I could get an audience to preach to that hated the Gospel. I sometimes long for hearers who would yell out their dissent and defiance; it would be such a relief after my sleekly supercilious congregation, who listen to me with such complete indifference and superior unconcern." Take the case of the assailed professor in Union Seminary. His views are already gaining a resonance which years of tolerated teaching could never have given them. If he is fortunate enough to be put out of his chair on their account, he will leap into an influence greater than that of all the teachers of his department in all the seminaries. If his opponents are wise, they will get him quietly back at his work again, and assure the world that his views are not worth troubling about. That would be the surest way to do what one of them professes to be aiming at, namely, to "squelch" him.

In the case of abstract truth especially, toleration has torn it from its consequences, and so made it more than ever intangible. Without intolerance there is no way of bringing it home to the mind as by a blow on the head. Doctor Servetus never indulged the suspicion, we may be sure, that he was burnt for a theological abstraction. The high mysteries of abstract thought were clothed with such consequences in his age that they could be grasped by the senses almost. To take one view meant comfort and applause; the other involved risk both to goods and life. That made controversy serious and gave truth a handle. Servetus's advanced ideas about the circulation of the blood were no more real to him than his theological views. For the latter, as for the former, he had the evidence of his senses; the severed artery sent out its jets, and the renounced creed burst into flames around the heretic.

Intolerance, too, would never have permitted the immense growth of foolish opinion in the world which has been fostered by our days of toleration. It would have been death to the increasing numbers of charlatans. Intolerance meant the beneficent law of struggle for existence; monstrosities went to the wall, freaks got no foothold; the brains once out, the man died. But now we cherish all sorts of absurd variations of thought, instead of mercifully killing them out of hand. There is nothing like a good persecution to show what convictions are worthy of being suffered for, what thoughts are clear and dignified, and what mere insanity. A man would take the trouble to verify his guesses if he found them leading him to the rack.

Another great blessing to be gained from the intolerance which some are deploring, is the making of certain moral issues sharp and intelligible. At present no man knows what subscription to the creed of the Presbyterian Church means. The vague terms in which it is couched, and the notorious toleration of radical dissent from important articles of the Confession, have led to an amount of moral shuffling and twisting of conscience which we know to be a source of shame to many in the Presbyterian ministry. They have groaned over the evil, but have not seen how to remove it. Nothing like an old-fashioned trial for heresy to straighten that thing out. It ought to be hailed, and we have no doubt it will be, by great numbers of the younger ministry and theological students who are now all in the fog. They may have to abandon their church, or they may feel that they can stay in it, but they will have a clear conscience in either case. All that these years of toleration have brought them is a miserable sense of being in a perilous, because ambiguous, moral position.

THROUGH RAILWAY ROUTES.

THE case of the New York and Northern Railway against the New York and New England Company, decided on May 6 by the Inter-State Commission, is especially important to owners and managers of railways, particularly as it seems at first reading to reverse the principle of the right of a transportation company to choose its connections in forming a through route. The New England Road runs across Connecticut to Brewsters, where a junction is made with the New York and Northern for New York city. For eight years these roads exchanged traffic to and from this city at through rates and proportions satisfactory to both. Two years ago a new line to New York was opened from New England via the Housatonic Railroad and the Sound. Because the same capitalists were interested in the New England and Housatonic Railroads, this latter was made the only New York line by the New York and New England Road, the old exchange of freight with the Northern line at Brewsters being stopped. The Northern Road thereupon appealed to the Inter-State Commission to compel a resumption of the former through route via Brewsters. This the Commission, in an opinion by Chairman Cooley, decides must be done.

The clause of the act to regulate commerce under which the action was brought, says that common carriers shall furnish reasonable and equal facilities in forwarding or receiving traffic to or from their connecting lines, and shall not discriminate between such connecting lines. It is held that the Housatonic and the Northern are both independent and connecting lines, and should be treated alike by the New England Road, since no objection was raised as to the fairness of the old contract when it was declared void, the new arrangement with the Housatonic being preference merely. On the facts of this particular case as given it is proper to say that the Northern Road seems to have been unfairly treated, and the decision of the Commission ordering the reopening of the through line via Brewsters appears to be a just one.

But the reasoning of Chairman Cooley seems to go further, and to imply that there is some obligation on the part of a railway to exchange traffic on equal terms with all other railways where the physical connections of the properties are equal. If any such doctrine can be construed in any form from the language of the Commission, it is a serious matter. It is acknowledged that no Commission or court now has authority to compel one road to exchange traffic or divide through rates with another, yet if such Commission or court can order the continuance of an arrangement once made, we have taken a long step towards compulsion in any case. It is also true that this power of opening a new route is given to the English Commissioners, and has been exercised by them, but this grew out of the railway situation in Great Britain, where a short road with chartered privileges might, by a consolidation of other roads, find itself cut off from a long-established traffic. Since the language of our Inter-State Act was taken from the English statute with this provision about compulsory through routes left out, it is a fair inference that the omission was intentional. The Lackawanna joins the New York Central at Syracuse; should the latter be compelled to send merchandise shipped from Buffalo to New York over the Lackawanna? Is the Central not in fairness entitled to carry its Buffalo freight to New York all the way over its own lines? If the Pennsylvania receives New York grain at Chicago, should it be ordered to hand the shipments over to the Reading at Philadelphia? Or if these things had once been done, should we compel their continuance?

But it may be said that the decision does not contain such statements; neither does it, yet, whether so intended or not, the wording does not exclude them. In the case of the New England Road, if the Housatonic had been amalgamated with it or if it had had its own line into New York, could it still justly be required to continue exchanging traffic with the Northern at its own expense? Nor could any argument about the previous fairness of the prorating arrangements have any weight in view of the changed conditions, for while it might have been for the benefit of the New England Road at one time to form a through line with the Northern, if there is a unity of interest now with the Housatonic, its business should be allowed to reshape itself. Hence the question of real profit to a carrier in changing its traffic from one connecting line to another is of the first importance. This point seems inadequately treated in Judge Cooley's opinion. He says: "The defendant has an ownership in the terminal company of one-half the stock, which makes it for its interest to shut off the participation of petitioner in the through business. This does not appear to affect at all the legal aspect of the case. If an interest in the line discriminated in favor of can preclude the operation of the prohibitive provisions of

law, the *amount* must be unimportant; 1 per cent. of the stock would be as good for the purpose as 50 per cent. But it is sufficient to say that the statute makes no exception for such a case." This language is very much broader than if Judge Cooley had simply said that the interest in the terminal company was not enough to warrant any discrimination in facilities on the part of the New York and New England in favor of the Housatonic; it seems a fair inference that ownership of one road by another would not justify a refusal to exchange traffic with a third competitive line. Such a principle never will be adopted in the United States, for no branches or extensions of existing roads will hereafter be built if the traffic of the new lines cannot be secured with certainty by the parent systems.

Commissioner Bragg prints an opinion in which he agrees to the conclusion reached in this particular case, but dissents from the reasoning. He says with truth that the Act "forbids a carrier from discriminating against 'a connecting line' and in favor of another 'connecting line,' but it does not require a carrier to discriminate *against itself*, by taking its business where it has a line of its own to a given destination and dividing that business with another line that is competitive with it to the same destination." The weakness of the Chairman's opinion seems to be at just this point. We ought not to follow English precedents too closely in railway questions when circumstances are very different. Our American carriers must open cheap through routes for long distances. Our only hope for this is a small profit for a long haul, and this in turn requires close business affiliations, if not actual consolidation, for the roads composing the route. If such long and affiliated or consolidated routes can be broken up and compulsory through lines be formed of two or four disjointed, inharmonious roads, we cannot expect such economic operation as will warrant low rates. If our tariffs were so high as to give a profit to each little link in a long chain, it would be different; the real situation is the reverse of that. We may acknowledge the apparent justice of the Commission's decision as regards the one road, the New York and Northern, while holding the reasoning and principles advanced to support it as essentially unsound for the United States.

THE CENSUS BULLETIN UPON MORTGAGE INDEBTEDNESS.

In that classical report of the proceedings of his surveying party, the lamented John Phœnix bequeathed to the cause of science some practical suggestions which have not always received attention from later investigators, but which, we are glad to see, have been appreciated and adopted by the Superintendent of the present census. It will be remembered that Mr. Phœnix, desiring to ascertain the distance from the city of San Francisco to a neighboring mission, employed a large force of assistants, supplied at Government expense with chronometers and various astronomical and trigonometrical appliances, together with a newly invented pedometer. When the observations and calculations had been completed, however, the results were found to exhibit such extraordinary discrepancies—the individual wearing the pedometer, for instance, having vitiated the record of that instrument, from which much was expected, by dancing for several hours with some miners in a drinking-saloon—that it was thought best to determine the required distance by asking one of the inhabitants about how far he thought it was.

This procedure has been substantially followed by the Superintendent of the Census in his inquiry as to indebtedness. The first step seems to have been to put upon his payroll some 2,500 presumably faithful "workers." The next step, under an act directing him to "collect the statistics of and relating to the recorded indebtedness of private corporations and individuals," was to decide that he would disregard the requirement as to corporations, their indebtedness being "something apart from the life and undertakings of the masses of the people." The problem was still further simplified by excluding liens upon crops, mechanics' liens, judgments by process of law, and chattel mortgages, on the grounds of expense and impracticability. There remained, then, little more than the comparatively simple task of compiling the records of instruments of the nature of real-estate mortgages made by private individuals—a labor which was prosecuted with such industry as to enable the Superintendent to point with pride to the abstracts of 9,000,000 mortgages now on file at Washington.

The sagacity of the Superintendent had enabled him to foresee, as he tells us, that many of these mortgages would represent extinguished indebtedness, and he resisted the suggestion of "various newspapers that the amount of the uncancelled mortgages should be accepted as the amount of the debt in force," upon the ground that this would be so gross an exaggeration as to make his statistics unworthy of confidence. But how was it possible to determine which of the apparently subsisting mortgages were paid and which were not? Here the pregnant suggestions of John Phœnix bore fruit. It was decided to make inquiries of the parties named in some of these mortgages and of "others who had the information" as to the fact of payment, and to assume that their statements would establish a law applicable to the whole country. These inquiries were accordingly prosecuted in about a hundred different counties, with the result of placing the general principles of mortgage indebtedness upon a new and purely American basis.

As to partial payments, a further application of the Phœnixian method was made. "The partial payments that had been made upon many thousands of mortgages were ascertained from savings banks, insurance companies, mortgage companies, trustees of estates, loan and trust companies, and holders of large numbers of mortgages, generally corporations. . . . The leading object in this trial was to get economically, and by application to a comparatively few lenders, statistics of partial payments distributed throughout a large number of the counties of the Union, which could not be obtained from private lenders on account of expense and their refusal to impart the information." We should have been inclined to attach some weight to returns made by institutions of the class described, but it has been found that these returns are so completely at variance with those obtained by asking the people of the vicinage that they "must probably be rejected." They are declared to be "valuable," but as the choice must be made between them and the answers given by individuals, the latter are preferred; the "remarkable success of the investigations in the 102 counties, which had not been looked for by statisticians of large experience," being a convincing argument in their favor.

In the Southern and many of the Western States the records do not commonly disclose the actual rates of interest, and many mortgages are for larger amounts than are really loaned. The statement often appears that the loan is made without interest, or a lower rate than the true one is named. The Census Bureau, however, has not allowed itself to be baulked by such subterfuges in its determination to fix average rates of interest, and its agents were instructed to inquire what rates were actually paid for loans in all cases where the parties had manifested a disposition to conceal them, and to insert such rates as were thought correct. Where second mortgages were considered by the agents to be for interest and commissions, they have not returned them as principal at all, but have converted them "into additions to the apparent rates of interest borne by the first mortgages." By making use of this elastic method, the determination of average interest rates has been rendered comparatively easy. The silence of mortgages as to the amount of land covered has occasioned no difficulty, the practice being to determine the average area covered by mortgages where the quantity of land was stated, and to write this average into the mortgages that were defective in this respect. It would seem from these investigations that nearly one-half of the land in Iowa and about 15 per cent. of that in Alabama is under mortgage, the average rate of interest paid being not far from 8 per cent. The two States named are the only ones covered by the present bulletin.

The principal criticism to be made upon this method of statistical investigation is that too many people were consulted. John Phœnix asked only one individual, and thus avoided the uncertainty that would have been occasioned by discordant replies. By neglecting this precaution the Superintendent of the Census has arrived at some very questionable results. The apparent debt is greater than the actual debt in various counties by amounts that range from less than 4 per cent. to over 531 per cent. It is almost incredible that such differences should really exist; and if they do, it is a conclusive argument against reasoning from the case of one

county to that of another. To average returns marked by such wide differences is to multiply errors, and we are unable to share the triumphant confidence of the Superintendent that his results do not vary from the truth by 5 per cent.

Nor can we admit that "even if the error should vary from 15 to 20 per cent., the results would still be of incalculable value," unless the word "incalculable" is to be taken in its primitive sense. These results are stated by the Superintendent to consist in attracting attention "to the dangers of these encumbrances, to the enormous burdens in the way of interest, to the alarming extent to which usury is practised, and to the defectiveness of these records in all parts of the country." But we are not informed what these novel dangers are, or what we should do about reducing the rate of interest, or how the heart of the usurer is to be softened, or in what way men are to be induced to have their mortgages cancelled when they pay them, if they do not choose to do so. The true value of such results as these is not indicated by a pile of 9,000,000 abstracts of mortgages at Washington, but by the money received as salaries by a horde of office-holders—which of course is a minus quantity so far as the people of the United States are concerned. It is quite probable that these lists of mortgages could have been obtained by application to the county clerks at a tenth of what they have cost, and in the country districts these functionaries could in many cases have given opinions as to the amount of subsisting indebtedness which would probably have been quite as near the truth as the testimony secured.

If the aim of this investigation was to show the average indebtedness of American citzens, it is obvious that it has not been attained. The omission of large classes of indebtedness would of itself vitiate the result. Furthermore, nothing is more common than for the same person to be both a mortgageor and a mortgagee, and no investigation would amount to anything that did not disentangle these relations. The creation of mortgages is but one development of the complicated system of credit under which modern business is carried on. It is seldom an indication of financial distress, but generally a sign of buoyant business. The attempt of the Census Bureau to disregard the statute under which it acts and ascertain actual and not merely recorded indebtedness, is inexcusable. No competent statistician would waste money in so absurd an enterprise. If there was a desire to learn whether the mortgageors of the country were really in danger, and burdened by interest and usury, the evidence of foreclosure decrees would have been relevant and trustworthy. This evidence, however, was deliberately rejected by the census officers, for what reason we cannot say. It will be interesting to learn the conclusions at which they arrive when they complete their labors in this department, but it is to be feared that they will be of a rather speculative character.

THE SOUTHWESTERN LAND COURT.

SANTA FÉ, N. M., May 18, 1891.

THE establishment by Congress of a special court for the settlement of grants and land titles of foreign origin, chiefly in the Southwestern Territories, is looked upon by the inhabitants of these Territories as a very important measure. It is confidently hoped that much good will result from the labors of that court.

The duties of its members require considerable erudition. There is not the least doubt that, with the great strides made in the United States in the knowledge of foreign legislation, foreign history, and foreign language, it will be easy to find persons particularly well qualified. The provision of the act excluding citizens of the Territories interested from becoming members of the Land Court is extremely wise. It secures absolute theoretic impartiality. The court may, in this manner, become as thoroughly impartial as a jury of marble monuments would prove to be in a case of divorce. It was also highly judicious to provide that the translator shall not be a resident or native of the land the documents of which he is to render into English. The terms which are sometimes used in those documents have become obsolete, and are at this day only known as provincialisms, limited often to a small territory, and any translator who is not versed in the Spanish of the Southwest is therefore not much exposed to misinterpretation, for the simple reason that, in most cases, he will not be able to interpret the terms in question at all. There is little danger of the minds of the judges being biassed by preconceived notions about the lay of the land in a country of which they have no idea, and concerning the inhabitants of which they lack all practical knowledge. In short, there is no doubt but that the composition of the court, as provided in the act, is likely to insure, *theoretically*, the most complete impartialty.

The court may be placed in something akin to a dilemma. There are in New Mexico, for instance, more than one kind of ancient grants and titles. Some of them convey absolute dominion, others were intended as usufructs only, still others include both. In regard to the validity of Spanish titles it may be observed that if the judges should base their rulings upon the Laws of the Indies or upon such passages thereof as they may have translated for reference, it would be surprising if a single grant should be considered valid, for there is not one grant in New Mexico that comes up to the requirements of the "Leyes de Indias" in regard to confirmation, registry, and attestation. For more than a hundred years under Spanish rule there was no public notary in New Mexico. Such defects may induce the court simply to reject all titles of that kind presented to them. Still, there has scarcely ever been any question raised as to the authority of Spanish Governors to grant lands, and their grants, although lacking the royal confirmation and the notarial certificates, have not been disputed, except in a very few cases. It may be now that (although there is no evidence of it) some knowledge was obtained, in Congress as well as in the Supreme Court, of the peculiar conditions under which New Mexico was governed and administered by the representatives of Spain. It may be also that some attention has been bestowed upon the Ordonnances of 1573, or upon the contract made in 1595 with Don Juan de Oñate, or the royal decree of 1608 concerning the administration of New Mexico. Should these documents have been overlooked, it would be well for the Land Court to pay some attention to them, since they virtually embody the basis upon which the validity of titles derived from Spanish Governors is founded. It might also not be amiss for the court to acquaint itself with the manner in which surveys of land were carried on a century ago, and not to insist (as some well-intentioned officers of the Government seem to have done) that the boundaries of tracts be determined after a system excellently fitted for regions where natural conditions are as different from those in the Southwest as the zebra is from the mountain sheep.

In regard to Mexican grants, the main difficulty consists in the state of chronic political confusion peculiar to the Mexican Republic until lately. During the many years of constant turmoil in Mexico, land laws were promulgated which applied to every portion of the country except New Mexico. That Territory was simply overlooked, in the same manner as the Principality of Lichtenstein is said to have been omitted and overlooked when the German States made peace with each other in 1866, so that the Prince of Lichtenstein is still officially at war with the German Empire to-day. Notwithstanding the fact that the colonization laws of Mexico are not applicable to the Territory of New Mexico, our Supreme Court has, in several instances, based its decisions upon such acts of the Mexican Congress. There is also considerable uncertainty in regard to the authority of Mexican officers to grant lands, and the extent to which that authority (in case it existed) could be exercised, and it may require some effort to determine these points with sufficient accuracy.

The proof of title may present considerable difficulty. Through the scattering and partial destruction of the archives at Santa Fé about twenty years ago, many documents have disappeared—at least from the surface. Claims may be presented without the support of original titles or certified copies thereof, solely on parole evidence, or circumstantial evidence embodied in papers relative to entirely distinct subjects. Some curiosity may be felt as to how the court will act in such cases—whether it will exact proof according to our present laws, or whether it will recognize the principles of international law, and accept evidence that would have been deemed sufficient at the time when New Mexico was Spanish or Mexican. There is, of course, not the slightest doubt that the court will enter upon the performance of its duties only after it has thoroughly prepared itself for the solution of such intricate questions.

On the whole, the court has before it a wide and highly interesting field. The so-called land grants have long been regarded as one of the main impediments to the settlement of the Southwest by immigrants from the East or from Europe. The time has come now to remove this obstacle. If, in addition to a speedy and equitable settlement of all these ancient claims, the court should succeed in increasing rainfall, in causing a rapid spread of timber, and in unearthing the treasure which is said to exist at the so-called "Gran Quivira," it will have made the population of the Southwestern Territories completely happy.

AD. F. BANDELIER.

THE NEW GALLERY.

LONDON, May, 1891.

IF at the Royal Academy cheap sentiment and indifferent technique prevail, at the New Gallery indifferent technique and affectation are the order of the day. In England genuinely good work is the last quality looked for

in painting, or indeed in any branch of art. If a man be but eccentric or self-assertive enough, whatever he may choose to do is pronounced great by the artless public. Where would be the fame of Mr. Irving but for his mannerisms? But for his repeated praise of his own methods, where Mr. Henry Arthur Jones's reputation? The Neo-Gothic primitives, with Mr. Burne-Jones as high priest, have ever been distinguished by their firm belief in themselves, and eccentricity has been their one standard of art. That at home they have achieved a popularity second only to that of the sentimentalists of Burlington House, therefore, is not strange. If their renown were confined to England, it would be matter of small surprise; but the result of their taking themselves so seriously is that they are sometimes accepted no less seriously even on the Continent. There was a curious proof of this not long ago. A group of artists in Brussels, supposed to represent all that is most modern and most thoroughly artistic in contemporary art, every year invite two English artists to contribute to their exhibition. This year their invitation included Mr. P. Wilson Steer, a member of the New English Art Club, a self-styled London Impressionist, and Mr. Walter Crane. The latter has also quite a following in Paris, not only as an illustrator of children's books and a designer, when he is often delightful, but as a painter, when he is almost always execrable. Of course, if a little of the work of one of the English mediæval schools is seen, it does well enough, its very eccentricity appealing to the morbid modern craving for novelty and excitement; and on the Continent it is only this little which is seen. But it is another question in England, where, year after year, not one but all paint exactly the same subjects in exactly the same manner, until their affectations have become unendurable.

Certainly Mr. Burne-Jones's favorite tricks of drawing have never seemed more irritating than in the two large works he sends to the exhibition just opened at the New Gallery. His color, which is usually supposed to make up for imperfect draughtsmanship, worse perspective, and, in a word, for his every technical shortcoming, this year is extremely unpleasant. Both his pictures are inharmonious arrangements in blue and green, while in both his deformed rendering of the human figure is absurdly exaggerated. This is specially the case in the larger of the two, "The Star of Bethlehem," an adoration of the Magi, painted for the Corporation of Birmingham. The Virgin sits under an arbor covered with sweetbriar, like that which trails through the "Briar Rose" series. To one side is St. Joseph, in front the angel and the three kings, and all alike have the same impossible, misshapen neck, bent forward at an ugly angle; all, even the negro, have the same type of face; all are equally fleshless and bloodless, made apparently of parchment and wood. The detail, particularly in the robes of the negro, shows remarkable patience and care, but, while it might be appropriate in a small cabinet picture, it is sadly out of place in a piece of mural decoration of such enormous proportions, meant to be looked at from a distance, in which the broadest handling would be the most effective. The unpleasantness of the color is the more marked because the design is almost the same as that which, a year ago, was reproduced in one of his fine tapestries by Mr. William Morris, who carried it out according to his own color scheme, using only Mr. Burne-Jones's drawing. The result was harmonious brilliancy very delightful to the eye, and it proved Mr. Morris the better co'orist of the two.

The second large Burne-Jones picture is the "Sponsa de Libano" of Solomon's Song, with the South Wind and the North Wind blowing upon her garden. There is in the foreground the usual lay figure, graceful in pose according to the Burne-Jones convention; but the two Winds, hovering in the air, are the veriest abortions, and anything more grotesque than the Burne-Jones face, with cheeks puffed out and lips projected in the act of blowing, could not be, except, indeed, the sickly greenish-blue draperies, twisted and knotted in a great parody of the Japanese swirl of life behind them. To the initiated there is scarcely a brushmark but has its hidden or literary meaning; the lover of good painting, however, would prefer less literature and more art.

Of the immediate followers of Mr. Burne-Jones, none rise above mediocrity of imitation, while at least one, his son, Mr. Philip Burne-Jones, sinks to the abyss of puerility by endeavoring to paint "Earth-Rise from the Moon." The belief that art is concerned with any and every thing rather than beauty of form, and line, and color, and perfection of workmanship is the curse of English painters; but none has it misled so hopelessly as the little group who teach—for the English painter of to-day is nothing if not didactic—that the highest duty of the artist is to paint, not what he sees, but what he imagines. This doctrine recently has been very eloquently expounded by Mr. Richmond. Portrait-painting he holds in contempt, because it is the mere rendering of real men and women. It is with the creations of the imagination alone that the true artist should be concerned; and he extols Mr. Burne-Jones because, when the latter introduces a casket, for example, in one of his pictures, he places no model before him, but paints one which he sees only with his mind's eye, this accounting, no doubt, for much that is otherwise incomprehensible in his drawing. Where a painter finds his models, or what he selects as subject, has nothing to do with the results which he chooses to show to the world: it is his affair, not ours. But when the spiritualism or idealism or morality or eccentricity of his subject preoccupies him so entirely that he gives nothing else on his canvas, that he is wholly indifferent to the manner in which he expresses it, then it is within one's right to say, This is not art, and pass on.

Mr. Richmond himself is an excellent witness to the demoralizing influence of his doctrine. His most important work, as probably he would consider it, he sends to the New Gallery. It is called "Amor Omnia Vincit," and presumably represents Venus just after her bath, with two attendants waiting to begin her toilet, a wide landscape showing beyond the marbles of the foreground. If his study of the nude were good, he might call it Venus and welcome; the name can make it neither better nor worse, can neither increase nor lessen its interest. But it is not good; the women of his imagination are made of wax and not flesh and blood; they are without modelling, and as flat as if they were cut out of paper. There is no character or beauty in their faces. Indeed, the faithful study of any St. John's Wood model, any coarse and hideous washerwoman such as Degas painted, would have had more interest, because greater individuality, greater reality than the flat, pale puppets of Mr. Richmond's imagining. And landscape, as his fancy sees it, reconciles one to Nature, who never, in her most brilliant moods, shows such crude and gaudy pinks and purples. The impression of so careful an observer as Monet has far more beauty, and consequently more artistic value, than the invention of a would-be idealist like Mr. Richmond.

Mr. Watts is another prominent member of the school who are all for the imagination. There have been times when splendor of color and a certain grandeur of form have distinguished his work and made it great despite, and not because, of his mistaken theory. But this year he is seen at his worst in a picture of the Flood, which will be remembered by visitors to his studio, where it has been hanging for some time. It may be curious to learn that a large mass of orange paint, looking like nothing so much as the section of a tree, represents his idea of a deluge, but certainly there is not even the suggestion of fine color or form, or of technical accomplishment, to give it artistic distinction. His "Nixie's Foundling," his only other canvas, is also one of his productions in which there is more imagination than art, and it must be counted one of his failures.

It would be useless to dwell at such length on the exhibited work which is least artistic, were it not that it gives the New Gallery collection whatever little character it has, and that it is the outcome of the most deplorable but most highly esteemed tendency in modern English art. Its very pretentiousness duly impresses that portion of the British public which prides itself on having outgrown the anecdotic stage of art as exemplified at Burlington House, not knowing that it has escaped one pitfall for the artless only to tumble into another.

There is some good work in the show, fortunately, but it is scattered here and there, it represents no particular school, as the landscapes were representative of the new Glasgow school at last year's Grosvenor; it does not occupy a conspicuous space in point of size on the walls; but while it may attract comparatively little attention from the casual visitor, to the artist it alone has any intrinsic worth. Foremost is a portrait by Mr. Sargent, not so striking as his Spanish dancing-girl at the Academy, but no less masterly. It shows a girl of fifteen or sixteen in a white gown, sitting on an oak bench and leaning against an old oak-wainscotted wall. Like "La Carmencita," it too has its faults: the face is unnecessarily chalky, the brown hair falling thick about it has rather too much of the quality of tow. But the hands folded in the lap, the foot in its white satin slipper, could hardly be better; and the gown, with all the delicate differences between the white stuffs of which it is made exquisitely suggested, is a masterpiece. But, above all, the portrait has character and individuality, and forces your attention; you remember the strangely repellant, somewhat evil face, just as you would remember a Velasquez, a Rembrandt, or a Franz Hals, long after you have forgotten the dressmaker's dummy which too many English artists elect to paint. Most of the portraits in the gallery are of no great importance; even the few that are good come a long way after Mr. Sargent's girl in white. One of the strongest is Mr. Rudyard Kipling, by the Hon. John Collier, who seems to have been inspired by his subject. While the other two portraits he exhibits are no better nor worse than those many a well-trained student might show, his Mr. Kipling is strong in character and sound in painting; there is vigorous brushwork and fine quality in the white Norfolk jacket. Mr. Edwin A. Ward is one of the most promising of the

younger portrait-painters, and if his Lord Randolph Churchill is not up to his standard, he also contributes the portrait of a little girl in a gray plush frock, which is delightful in its artistic simplicity of treatment, and a refreshing contrast to the Cherry-Ripe type of the popular child picture. Mr. Herkomer, Mr. Richmond, and Sir John E. Millais have rarely turned out worse portraits. But it is a pleasure to find that Mr. Shannon (an American, by the way), in painting Miss Clough of Newnham, has not been overpowered by millinery, as he too often is, but has given a good, straightforward rendering of a woman of mature years and strongly marked character.

On the whole, the landscapes reach a higher level than the portraits. Here again Mr. Adrian Stokes is to the fore, and with a more interesting and pictorial subject than that of his Academy picture, though this subject—a quiet sunset from high Cornish downs overlooking the sea, a woman and two cows in the foreground—would have availed him little had he not succeeded so marvellously in rendering the atmospheric effects and the feeling of an evening when the sun sinks in a great ball of fire behind a bank of clouds on the horizon, and a light mist rises from the sea. Nature has few subtler phases, but his impression is as true as it is restrained. The well-drawn, firmly modelled cows and woman have that strange, almost unreal look that the hour lends to all things, but there is no exaggeration, no meretricious sentiment. There could not be more speaking proof of the fallacy of the Richmond theory; because of his fidelity to nature, Mr. Stokes has filled his canvas with that poetic charm which Mr. Richmond's imagination has so signally failed to give to his Venus and her surrounding. Mr. Arthur Lemon and Mr. Arthur Tomson, who always paint with refinement and breadth of handling, also have good landscapes, strong in the right open-air feeling. And there is notable work by Mr. T. Hope McLachlan, who usually shows Nature in her most dramatic moments, but without melodrama or claptrap; by Mr. J. Denovan Adam, a Scotchman, who knows how to paint Highland cattle; and by Mr. Alfred East, who, at his best, is a painter of some little distinction.

Mr. Alfred Parsons this year has been content to reserve most of his work for an exhibition he gave a month or so ago at the Fine Art Society's on Bond Street. He has nothing at the Academy save a black-and-white drawing already reproduced in *Harper's*. But at the New Gallery, though a small landscape is of no special interest, he shows one of the strongest pieces of work he has done for a long time: a vase of poppies on a window seat, with a landscape dimly seen through the muslin curtain at the window behind it. The technique is no less brilliant than the color. It is marked by far greater freedom of handling than he has accustomed us to expect from him. Two fresh, breezy seas by Mr. Henry Moore, a typical Tadema, but of less artistic importance than the Academy Tadema, landscapes by Mr. John R. Reid, and a striking little interior by Miss Flora M. Reid, are about the only remaining contributions of interest.

The water-colors are more hopelessly commonplace than the collection at Burlington House; it would have been wiser to hang none. Illustration is represented by Mr. Edward T. Reed, one of the newer *Punch* men, a draughtsman without style or refinement or force. No branch of art is so completely ignored in the large London galleries as illustration. There are good black-and-white men, American or English, in London, and yet Messrs. Hallé and Carr's choice has fallen upon one of the least merit or standing; while, as if in satire, we have Sir Frederick Leighton at the Royal Academy banquet singing the praises of Charles Keene, the most distinguished of all English draughtsmen, to whom the Academy never accorded the slightest recognition during his lifetime. A major-general, unknown in the art world, contributes the only etchings; as I said of the water-colors, far better would it have been to show none. And but little more wisdom has been displayed in the selection of sculpture. There are a few busts and reliefs fairly good, but nothing of sufficient importance to call for special mention here. N. N.

GONCOURT'S JOURNAL.

PARIS, May 14, 1891.

FROM time to time there appears a new volume of the 'Journal des Goncourt.' I have now before me the fifth volume, which has made more noise than its predecessors on account of a preface which is addressed to Renan. You will perhaps remember that the notes (for these volumes are a mere succession of notes) of the fourth volume had been written chiefly during the siege of Paris and the Commune, and that Goncourt gave a lively account of the conversation which took place during that period at the monthly dinners of the little literary and scientific society of which Renan was a member. Renan was much offended by the indiscretion of Goncourt, and he expressed his disapprobation in strong terms. He wrote to a friend a letter which was published in a Breton paper called the *Petit Lannionais* (from the town of Lannion): "All these accounts given by M. de Goncourt of dinners of which he had no right to make himself the historiographer, are complete transformations of the truth. He did not understand, and he attributes to us what his mind, closed to all general ideas, made him believe or hear. As for what concerns myself, I protest, with all my strength, against this sorrowful reporting. . . . I hold it as a principle that the babbling of fools is of no consequence."

We might well say here, "genus irritabile vatum." Renan was especially angry because, during the war, he expressed sentiments which were not those of a *chauvin*—which superficial readers might call unpatriotic. M. de Goncourt maintains that, during the two or three years which preceded the war, the superiority of German science, of everything German, was one of the common topics of conversation at the monthly dinners at Magny's. I knew intimately Nefftzer and Scherer, and I am sure that this assertion of Goncourt's is correct. Renan's exegetic work was in its most scientific part inspired by Germany; it was perfectly natural—and why should he reject the imputation?—that when Renan and some of his friends found France dragged into war against her own will by Napoleon III., when they saw France unprepared for this terrible war, they prophesied the triumph of Germany? It does not follow that they rejoiced in the humiliation of their own country.

In the midst of exciting events, the opinions of such men as Renan may well at times take an excited and paradoxical form. It is my own opinion that M. de Goncourt would have done better not to report almost literally conversations held in the fearful circumstances which he describes. On the other hand, since he had done so, Renan would have done better to ignore this publication and to treat it with complete indifference. M. de Goncourt himself admits in his preface that he was indiscreet. "I accept the reproach," says he, "and I am not ashamed of it, as my indiscretions are not divulgations concerning private life, but divulgations of the thoughts and ideas of my contemporaries—documents for the intellectual history of our century. . . . Since the world began, memoirs in the least interesting have been written only by indiscreet people." Goncourt tells us that his accounts of the dinners at Magny's were always written the same evening or, at the latest, the next morning. If he has a merit it is exactitude; he says that his notes "suent l'authenticité."

The fifth volume begins with the year 1872 and ends in 1877; it extends, therefore, over that period during which France was in an equivocal political condition—a Republic in name and *de facto*, but not yet a Republic *de jure*. The Empire had come to an end, but on January 1, 1872, Goncourt writes: "A day or two since, finding in the Rue de la Paix a number of fine carriages, as many as at a first representation at the French Theatre, I asked myself, Who is the great personage whose door is besieged by so many fine people? when, lifting my gaze above the door, I read 'Worth.' Paris continues to be the Paris of the Empire."

Goncourt had, on March 2, 1872, at his own house at dinner, Flaubert, Théophile Gautier, and Turgeneff. How well he describes "Turgeneff, the mild giant, the amiable barbarian, with his white hair falling over his eyes, the deep furrow which cuts his forehead from one temple to the other, like the trace of a plough, with his infantine voice. From the soup he charms us, he garlands us (as the Russian expression is), by his mixture of naïveté and finesse. He has all the seductiveness of the Slav race, a seductiveness which is heightened by the originality of an individual mind, and by an immense and cosmopolitan knowledge." Turgeneff told the company how he was put in prison for a month after the publication of his 'Mémoires d'un Chasseur.' He fraternized with the chief of the police, and gave him champagne to drink, till, one day, this policeman lifted his glass and drank "to Robespierre!" "Yes," said Turgeneff, "if I were proud, I would have people write on my tomb only what that book did for the emancipation of the serfs. The Emperor Alexander intimated to me that the reading of my book was one of the great motives that determined him." Many are Goncourt's confidences concerning Turgeneff, and I am sorry to say they are not always pleasant. But it is impossible for those who knew Turgeneff not to recognize him, with all his charm and all his weaknesses, with his originality of thought and expression.

This is what Turgeneff says of Taine: "The comparison is not a noble one, but allow me to compare Taine to a pointer I once had; he stopped, he looked about, he had all the motions of a pointer, only he had no nose. I was obliged to sell him." One day Zola was complaining loudly: "I shall never be decorated. I shall never belong to the Academy. I shall never have one of those distinctions which are the affirmation of talent with the great public. I shall always be a pariah; yes, a pariah." And he repeated this word "pariah" four or five times. Turgeneff looked at him with a sort of paternal irony, and told him he was invited to the Russian Embassy, to a banquet given on the occasion of the emancipation of the serfs. He had had something to do with this emancipation, and his friend Prince Orloff, the Russian Ambassador at the time, had not forgotten him. "I am not, perhaps, in Russia the first Russian littérateur; but in Paris, as

there was no other, you will concede that I was the first. Well, under these circumstances, do you know how I was placed at table? I had the forty-seventh place. I was placed after the pope, and you know how the pope is despised in Russia."

It is difficult to give an analysis of a book like the 'Journal des Goncourt.' All you can do is to note certain traits which concern interesting characters. Turgeneff comes out in high relief, but I am sorry that Goncourt shows a sort of prurient pleasure in repeating the most extraordinary recollections of Turgeneff. The 'Journal' could hardly be placed in the hands of a decent woman, even if she was an old woman; and some of the pages in it have spoiled Turgeneff for me. Daudet's physiognomy also comes out very vividly—Daudet of the sunny South, with his semi-Bohemian ways, his extraordinary powers of observation. One day Daudet tells at Flaubert's house the story of his childhood. "It was passed in a house without money, with a father who changed his trade every day, in the eternal fog of Lyons." At the age of twelve, Daudet read poetry, works of the imagination "which exalted his brain; his readings were carried on in the drunkenness produced by liquors which he had stolen at home." "Daudet is the pretty, hairy young man with an eyeglass, who throws back every moment superbly his long hair. He speaks amusingly of his impudent way of putting in his books whatever furnishes him literary observations." You will find in every book of Daudet's observations taken from life; a Parisian can affix names to almost all his characters. We are shown Daudet's life in his little country house at Champrosay, in the old Hôtel Lamoignon, in the Marais. "He has lived in this hôtel for seven years (since 1875), and tells me that the house has been good for him; it has made him calmer and wiser. He had a feverish youth, a youth which long preserved, as he expressed it, the swell, the last undulations of the sea after the tempest. Well, in this quiet house, pacific and sleepy, he has been transformed, and his laborious purring has made another man of him." Workingmen all over the world are making a great stir about the limitation of the hours of labor. What do you think of this written on the 9th of October, 1877, at Champrosay? "Daudet is killing himself. For five months he has been working from four o'clock in the morning to eight, from nine to twelve, from two to six, from eight to midnight—in all twenty hours' work." As a comment it is necessary to say that Daudet is now suffering from a nervous disease.

Nobody is more often mentioned in these notes of Goncourt's than his friend Flaubert, the author of 'Madame Bovary.' There was more than a common friendship between them—there was a literary friendship. They were both naturalists, realists, the first of a class which has become very large. As far back as 1872 Goncourt wrote: "Flaubert is, at the present moment, so cross, so cutting, so irascible, so angry at everything and at nothing, that I fear my poor friend will suffer a nervous breakdown." We know, by the indiscretion of Maxime Ducamp, that Flaubert had epileptic fits, which he carefully concealed; his nervous system was at all times in a disordered state, and his temper was the result of his health. His sensitiveness was extreme. The idea of travelling in a railway carriage opposite a man whose face might be disagreeable to him, made him uncomfortable and hindered him from travelling. "No," said he one day, "I cannot bear any annoyance. The notaries of Rouen look upon me as a madman; in a matter of an inheritance I said to them, 'Let my co-heirs take all they want, but don't speak to me of anything—I would rather be robbed than annoyed'; and it is so with everything, with my publishers." Goncourt paints very vividly this physical disorganization in a man who was built like a giant, and makes sad reflections on those who indulge in excessive brain work: "It is positive that we are all ill, all mad, and ready to become completely so."

On the whole, these Journals will remain a valuable, though very incomplete, document for the literary history of our time.

Correspondence.

FURTHER DISCOVERIES AMONG THE BRITISH MUSEUM PAPYRI.

To the Editor of The Nation:

Sir: A small volume will appear containing the unpublished papyri of literary interest in the British Museum. Their preparation and publication is under the direction of Mr. Kenyon, to whom is due the *editio princeps*, so justly admired in Germany and America, as well as in England, of Aristotle's 'Constitution of Athens.'

The most noteworthy addition to the known body of Greek literature which the new volume will bring, consists of seven poems of about 100 lines each, written by Herodas (Herondas or Herodes). From these, scholars will doubtless be able to determine, if not the orthography of his name, at least the time when this poet lived. The date hitherto assigned has varied between the early period of Hipponax and the Alexandrine age of Callimachus. The twenty-five lines of his composition hitherto known consist of fragments, the longest and least obscure of which comprises four lines. All but one are in the hobbling iambic metre invented for satirical purposes by Hipponax and called the choliambic measure. It is interesting to find that all the new verses of Herodas are in this same comically hamstrung rhythm. They are described by Mr. Kenyon as "dramatic idylls," and are chiefly of domestic interest. One contains an account of the visit paid by a party of women to a temple of Æsculapius. Interesting allusion is made to works of art in the temple, and a well-known passage in the "Ion" of Euripides may possibly have been in the mind of the poet. This has its bearing upon the date of composition, and may give support to Bergk's surmise that Herodas was a contemporary of Xenophon, whose son Gryllus he is supposed to mention.

The characteristic liveliness of our "iambographer" has full scope in another of the new poems, where the mother of an incorrigible "mauvais sujet" brings him for salutary flogging to the schoolmaster. It is to be hoped that the boy was not old enough or not clever enough to turn upon his wrathful mother with that charming line of Herodas which declares that "an agreeable woman is bound to stand anything."

The diction of these poems, like that of the shreds and patches of Herodas already known, is very strange. The MS. is a long and narrow papyrus-roll, well preserved only in the middle. One end is badly rubbed, while the worms have had their way with the other.

A second papyrus contains nine narrow columns of an attack—presumably, but not certainly, by Hyperides—upon a political opponent whom he arraigns for violation of the Constitution. The beginning of this speech is lacking; its ending is preserved intact.

With this absolutely new material will also appear collations of parts of works already well known. These papyri contain nearly the whole of three books of the 'Iliad' (ii–iv), considerable fragments of two books (xxiii and xxiv), and small bits from four others (i, v, xvi, and xviii). The back of the papyrus containing 'Iliad' ii–iv has written upon it the text of a grammatical treatise bearing the name of Tryphon. It is to be hoped that this also may be published, as well as a collation of Isocrates "de Pace" and of the third epistle of Demosthenes, both of which are among the treasures of Mr. Kenyon. Treasures they surely must be called, since their date appears to range between 100 B. C. and 500 A. D.

Yours very truly,
Louis Dyer.

London, May 16, 1891.

THE BIRTH-RATE.

To the Editor of The Nation:

Sir: In reading your notice of Prof. Richet's paper in *La Réforme Sociale* upon the French birth-rate, I was impressed anew, as I have been many times before, by what seems to me the extreme obtuseness of writers upon sociology in regard to the really serious side of the population question. Nearly all such writers seem to assume that a rapid increase in population is a good thing in itself, and is to be taken as a true measure of prosperity in a nation or a community. This tendency was most amusingly shown in almost all our journals last year in the discussion upon the results of the census. It seemed to be taken for granted that it is vastly better to have five hundred people in a town than four hundred, and a million and a half in a city than a million; yet upon reflection scarcely anything could appear more absurd than this assumption.

As you so well say, "The most likely way for any nation to be happy is for all the individuals in it to be happy," and I think that it would be difficult to prove that this universal happiness is sure to result from a rapid increase in population. To my mind, the really vital and alarming fact is, that, under the present conditions of our civilization, society is continually dying at the top. In the lowest walks of life, and especially in the most crowded parts of our great cities, and where the means of livelihood are most meagre and most precarious, the capacity for reproduction, following early marriages or illicit unions, seems as illimitable as it is unrestrained, while in the more prosperous and well-to-do classes marriages occur later and the number of offspring becomes less; and in the majority of families which have experienced several generations of comparative ease and culture, the numbers become stationary, then decline, and finally the families themselves, so far as public knowledge goes, become extinct.

This, in its two aspects—the crowding into life at the bottom of the scale, the rapid thinning out at the top—is no light matter. Indeed, it seems to me to so far exceed in importance every other fact in sociology as to render any speculation upon social conditions, or any proposed remedy for social evils, which fails to take it into account, comparatively, if not absolutely, worthless. Thanks to our commercial system, we may assume that of late years there has always been enough food in existence for the existing population, and food is the necessary condition of continued life and all life's possibilities. It is true that this food has not always reached the mouths which were waiting for it, but, alas! it seems likewise true that this has been the sole effective con-

servative influence which kept matters from becoming worse than they actually have been. The fact upon which Malthus so much insisted, that population tends to increase more rapidly than the means of subsistence, *is* a fact as regards the poverty-stricken classes of all great cities, and, in my judgment, no scheme of social reform, Socialistic or Anarchistic, can ever by any possibility be effective in the removal of misery and degradation which does not recognize this fact, and in some way tend to restrict increase in the lowest stratum of the "dependent classes." The struggle for existence which Darwin showed characterizes all organic life, is as positive in the human family as elsewhere, and it can only be happily controlled by the exercise of intellectual power.

Whether in the case of families of long standing there is an inevitable tendency to actual infertility such as must result in their extinction, is not yet clear; the accumulated data are insufficient to base a conclusion upon. That there is a considerable decrease in fertility seems certain, but other causes may account for much of the result which might mistakenly be traced to this.

Whether means can be found to combat effectively the two tendencies which I have described remains to be decided, and until this *is* decided, the future of our civilization is an uncertain quantity. Considering, however, the horribly rapid growth of our great cities, with the thousands and tens of thousands huddled together in their swarming tenement-house districts, the problem is one which is ever pressing more and more strongly for a solution. WILLIAM POTTS.

MAY 23, 1891.

ETCHINGS AND PHOTOGRAVURES.

TO THE EDITOR OF THE NATION:

SIR: May I state in reply to Mr. Hamerton that I have never "tried to depreciate etching"? Certainly, in the illustration of books, reproductions of pen drawings have taken the place of etchings; but to say this does not imply that the artistic value of etching has been lessened. As an etcher and a pen draughtsman I can appreciate both arts. And if both could be printed with letter-press, I should practise the one as much as the other.—Yours truly,

JOSEPH PENNELL.

LONDON, May 12, 1891.

Notes.

HARPERS & BROS. will publish directly Margaret O. W. Oliphant's 'Memoir of the Life of Laurence Oliphant and of Alice Oliphant his wife,' in two volumes; 'A Flying Trip around the World,' by Elizabeth Bisland; Matthew Arnold's selection from the Poems of Wordsworth; and 'What to Eat—How to Serve It,' by Christine Terhune Herrick.

D. Appleton & Co. will add to their summer series of light reading 'From Shadow to Sunlight,' a novelette by the Marquis of Lorne.

Dr. Julius Froebel has finally yielded to the importunities of his friends and the wishes of his publisher, and abandoned his original intention of not permitting the second volume of his autobiography, 'Ein Lebenslauf,' to be issued until after his death. After revising the manuscript and changing some forms of expression which might be offensive to persons still living, but without omitting anything of importance or modifying his views in the slightest degree, he has now placed it in the hands of the printer, and the appearance of this valuable contribution to the recent and contemporary political history of Germany and of Europe may be expected at an early date. Froebel's vigorous old age, which promises yet many years of life, seemed to render any further delay in the publication of a work of so great and immediate interest to the present generation undesirable.

By the death of the retired Prof. Eduard Wilhelm Reuss at his home near Strassburg on April 15, Germany has lost one of her chief pioneers in the contiguous provinces of modern Protestant theology and Oriental scholarship. Reuss, born at Strassburg July 18, 1804, was strongly attached and always remained true to his native city, which no promises of academical preferment could ever induce him to leave. Physically slight, he possessed marvellous powers of endurance, and in this respect resembled Döllinger, with whom he had, besides vast learning and a tenacious memory, quite a number of marked intellectual traits in common. As one might naturally expect from their respective confessions or systems of faith, the Protestant was stronger in Biblicism and hermeneutics, and the Catholic more at home in ecclesiastical history and dogmatics. Reuss was diligent with his pen to the very last, and among his posthumous papers are numerous poems, dissertations, and extended records of his thoughts and experiences in the form of diaries which, it is to be hoped, will be given to the public.

It will rejoice the hearts of bibliophiles as well as of Biblical students to learn that the famous Greek manuscript of the New Testament, which dates from the fifth century and constitutes one of the chief treasures of the Vatican Library, where it is well known to scholars by its catalogue number 1209, is now being phototypically facsimiled by order of Pope Leo XIII., who intends to present a copy of the work to each of the principal libraries of Christendom. It is to be hoped that none of our large public and university libraries will be overlooked by the official dispensers of this generosity.

'Des Herrn Friedrich Ost's Erlebnisse in der Welt Bellamy's' is the title of a recent novel by Konrad Wilbrandt, a member of the German Imperial Diet and a writer of some note on political and economical topics. The experiences of Friedrich Ost are intended to show the practical difficulties that would necessarily arise from a State monopoly of all the social, political, domestic, industrial, and intellectual activities of mankind as imagined and described by Bellamy in 'Looking Backward'; and to prove that this millennial golden age of the future, like the mythical golden age of the past, is merely a poet's dream.

About three years ago Mr. Theodore Kirchhoff of San Francisco made a trip to Hawaii, an account of which he now publishes under the title of 'Eine Reise nach Hawaii' (E. Steiger). He manages to convey a considerable amount of useful information of the regulation guide-book variety, and his way of putting it might be pronounced quite inoffensive except for an occasional lapse into a facetiousness which, being of the stereotyped beer-commers style, is not always in the best of taste.

'Hassan le Janissaire' (Paris: Armand Colin & Cie.), by Léon Cahun, purports to be an historical novel with its scene laid in Turkey in the sixteenth century; it might as well be in China in the first century, for its characters are nothing but marionettes, and its incidents are of a sufficiently blood-curdling description to suit any age or country. It might be regarded as a new type of the prevailing dialect story, being plentifully larded with Turkish words which convey no meaning to the reader and add to the indigestibility of the book.

'Sesame and Lilies' has just been added to the 'Brantwood Edition' of Ruskin's Works published in this country, by authority, by Charles E. Merrill & Co. Prof. Norton furnishes again an introduction.

G. P. Putnam's Sons have issued a popular edition, in a single volume, of Prof. Charles F. Richardson's 'American Literature (1607–1885).' It is in every respect a presentable book, and the purchaser will, in view of the lower price, forgive the retention of two indexes, whereas their amalgamation might have been looked for. The original two volumes, it will be remembered, appeared at an interval in 1886 and 1888.

Mrs. Hawthorne's 'Notes in England and Italy' were made public by the reluctant author a little more than twenty years ago. They now appear anew with a changed imprint (Houghton, Mifflin & Co.), and with a portrait of Mrs. Hawthorne etched by Schoff. The Italian portion is quite two-thirds of the volume, and is largely devoted to works of art.

The same publishers send us the revised Sweetser's 'White Mountains' (eleventh edition) and 'Maritime Provinces' (eighth edition). They are incomparable handbooks for the tourist, and they are faithfully kept up to date.

Mr. James Clegg, Wet Rake, Rochdale, England, has got out a third edition of his 'Directory of Second-Hand Booksellers, and List of Public Libraries, British and Foreign.' Other topics than those mentioned in the title are "Fictitious Names, etc., used by Authors and Book Illustrators," a curious array; "Initials Used by Authors," "Book Collectors Wanting Catalogues and Reports," "Bibliographical Works of Reference," "Ancient Centres of Printing, with their Latin Equivalents"; "Glossary of Terms Used in Literature and the Book and Printing Trades"; "Abbreviations," and much other information of a convenient sort for literary workers. The list of second-hand-book sellers is the completest undertaking of all those we have enumerated. Mr. Clegg has trebled the size of the previous edition (1888).

The ninth volume of Mr. Worthington C. Ford's edition of the Writings of Washington (G. P. Putnam's Sons) covers parts of three years, 1780-1782. Beginning with the revolt of the Pennsylvania and Jersey lines, and subsequent troubles with the troops of Massachusetts and New York, aggravated by a general state of military unpreparedness and deficiency, it takes in the surrender of Cornwallis, and ends with Washington's plan of campaign drawn up at Newburgh on May 1, 1782. The disturbance between the "Vermontese" and the New Yorkers, and the suspicious conferences of the former with the British in Canada, are also visible in these pages. Washington's private personality shines out in connection with his Virginia estate, from which some of his slaves are seduced by the enemy, and others have to be sold to pay taxes. Of special interest is the letter to Benjamin Harrison, Speaker of the Virginia Assembly, objecting to the movement in that body to pension Washington's mother.

Mr. Reuben Gold Thwaites's 'The Colonies, 1492–1750' (Longmans) is a swift sketch of the American colonies down to the very eve of the Revolution. It is highly condensed—perhaps, indeed, it is somewhat too full of nutriment for the uninformed—and its arrangement is orderly and convenient. After the necessary account of early settlements, the manual proceeds, on three main lines, to treat severally of the Southern,

Middle, and New England divisions in their political, social, and economic aspects, not forgetting meanwhile to include the other English colonies and New France. Like most compendiums, it will principally invite those able by previous familiarity with the subject to follow easily so rapid a movement. The subject is virtually a fresh one as approached by Mr. Thwaites. Mr. Lodge's 'Short History of the English Colonies' is more leisurely in its treatment, more restricted in its scope, and does not anticipate the plan herein followed. The present volume is the first of the "Epochs of American History," a series having for its editor Dr. Albert B. Hart of Cambridge. It is a pleasure to call especial attention to some most helpful and not overdone bibliographical notes provided by the editor at the head of each chapter, which he should feel encouraged to continue in future volumes. These aids are made in the spirit of the healthy activity in historical study which has been so stimulating a factor in Harvard College for the past fifteen years, so that any one desirous to pursue a larger method of investigation will do well to follow Dr. Hart's notes.

The Messrs. Putnam have reissued the valuable repertory of 'Documents Illustrative of American History, 1606-1863,' compiled by Howard W. Preston, and first published in 1886. We observe no changes in it except typographical.

'Light in Africa' (London: Hodder & Stoughton), by the Rev. James Macdonald, is mainly an account of missionary work in Kaffraria between the years 1875 and 1887. It gives, on the whole, an encouraging view of the progress of the natives, especially in industrial education. Life at an exposed station during one of the frequent wars between the different tribes is also graphically described. The most valuable chapter is that upon the habits and customs of the natives, in which numerous interesting facts and observations relating to nearly every phase of native life and belief are to be found. Witchcraft holds, of course, a prominent place in their lives, but of religion there is almost nothing. Human sacrifices are absolutely unknown, and there are no very distinct traces of fetish. While believing in the existence of the spirit, the natives have no idea of a resurrection, yet have a crude conception of creation and a singular theory as to the origin of death, that it "came into the world by a fraud." Equally interesting is their tradition as to their migration from the centre of the continent, which bears such a close resemblance to a well-known classical story as to make its originality doubtful.

The State Commissioners of the Topographical Survey of Rhode Island are now preparing an edition of their map on four sheets on a scale of an inch to a mile, with contours, including the whole State and adjoining parts of Connecticut and Massachusetts. This large map is made by combination of the small sheets of the Government form of publication, with the addition of the State and county lines in a light red color. An appropriation of $4,500 has been made by the Legislature for the preparation and distribution of the map to the schools and public libraries of the State, in this, as in the map itself, following the example of New Jersey. Proof sheets of half the map, just brought from the press, are now open to inspection in the exhibition of the Brooklyn Institute's geographical collection in Boston during the present month. The entire map will be about four by six feet. When complete, it will be on sale to the public at moderate cost.

We have received the first numbers of a new weekly German Republican high-tariff organ, called the *National-Zeitung*, which was launched this month in Chicago. In form (quarto) it is much more attractive than the generality of newspapers published in German, and its contents are varied and interesting. The editor is Joseph Brucker. In the second number, Julius Gugler of Milwaukee furnishes translations into German of Whittier's new poem, "Immortality," and Howells's poem, "Mortality," and intimates that the musical friend who called his attention to the former will presently set it to music—we presume in the German version. It has not been the lot of the Quaker poet to be thus honored as freely as was Longfellow, and, indeed, we recall only his own adaptation of a Frémont campaign song ("Sound now the trumpet warningly") to the air *Suoni la tromba*. This song is not included in his collected works, and search of it in its published sheet-music form has proved unavailing.

Mr. Hamerton continues his chapters on "The Present State of the Fine Arts in France" in the April and May numbers of the *Portfolio* (Macmillan). He deals with Impressionism and with the Survival of Classical Sentiment, throwing a good deal of light on the former term, and illustrating both subjects by reference to the works of artists in the respective categories. Reviews of W. J. Linton's 'Masters of Wood-Engraving' and of Pillet's 'Madame Vigée-le-Brun' occupy considerable space in these numbers.

In its last half-dozen issues *L'Art* (Macmillan) concludes the review of a century of *salonniers*, or critics of art exhibitions, in France, gives another instalment of its century of engraving (1789–1889) in connection with the late Exposition, notices with portraits the composer César Franck and the painter Émile van Marcke de Lummen, both Frenchmen—though the one was born in Belgium and the other was of a Flemish family—discusses Abraham Bosse and his work as an engraver, and has, besides, the usual miscellany. A full-page portrait in eau-forte of President Carnot accompanies No. 642.

"E." writes to us: "In your notice of Symes's 'The Prelude to Modern History' (No. 1346), the critic states that 'the Gothic historian Jornandes is disguised as 'Jordanes,' and intimates that this is a slip of the pen on the part of the author. Such is not the case. 'Jornandes' is used by Grimm, Wackernagel, and other writers, but the only form of the name found in manuscripts and early documents is 'Jordanes,' and this is now generally accepted by scholars as the proper orthography."

"T. B." writes from Leipzig: "In Bescherelle's 'Dictionnaire National' (1856) I find, under *escalier*, the following quotation from Imbert (place not given): 'On s'avise souvent sur l'escalier d'un bon mot qu'on a manqué de dire dans la chambre.'"

The strong and genial face of the late lamented naturalist Joseph Leidy has been fixed for posterity by Mr. F. Gutekunst, Philadelphia, in his imperial panel series. It would adorn any museum.

—The regular scientific organization of "Psychical Research" seems to proceed apace. We have received the first numbers of two new journals devoted to the subject, one published in Leipzig by Abel, the other in Paris by Alcan. The German one is entitled *Schriften der Gesellschaft für Psychologische Forschung*, and is edited by Dr. Max Dessoir. The French one is the *Annales des Sciences Psychiques*, and is edited by Dr. Dariex. Both seem characterized by a severely accurate and critical spirit, though the contents of the *Annales* is much more meagre than that of the *Schriften;* the only strictly new matter of fact in this number of the former being the record of four cases of "veridical hallucination" gathered at first hand, with the accompanying documents, by the editor. Prof. Charles Richet contributes a preface; and presumably the periodical will grow. It is to appear every two months. The German journal is thicker (90 pp.) and richer. Its most interesting contribution is a paper by Dr. Von Schrenk-Notzing on the relation of narcotics to hypnosis. The facts have been previously known, but are here brought together and studied systematically for the first time. Non-hypnotizable persons may be hypnotized after taking a few whiffs of ether and chloroform, and then by suggestion made hypnotizable in future without these agents. By combining a small dose of chloroform with hypnotic procedure complete anæsthesia can be readily induced. Hashish produces great suggestibility, without any of the common hypnotic processes being used. All the ordinary hypnotic phenomena can be observed in persons intoxicated with this drug. There are many able men at work in Germany upon all these borderland phenomena; and since this new journal is the combined organ of the Berlin and Munich Psychical Research Societies, it is fair to predict for it a vigorous future.

—Our own Anglo-American "S. P. R." shows no symptoms of diminution of vigor. Its Proceedings appear regularly three or four times a year, always with some new record of facts, reported so authentically, and discussed so impartially, as to have permanent "documentary" importance. The collection is already of great value. Earlier reports of supernormal occurrences, abundantly as they lie scattered through literature, are practically unutilizable, for the vague and uncritical character of the record makes it usually easy to doubt what the alleged fact really was or whether it took place at all. The great function of a psychical-research society seems to be that of a sort of weather-bureau for catching these meteor-like phenomena as they happen, and putting them on record in so irreproachable a way that they *can* serve as authentic material for future natural philosophers to lay at the base of their speculations. This demands above all a certain longevity on the Society's part—the importance of its records being essentially accumulative. It demands also patience on the members' part, and a capacity for being satisfied with a good deal of humdrum detail of no very "sensational" interest. In the number just published of the Proceedings, there is the beginning of what promises to be a vigorous discussion of the evidence for clairvoyance, by Mrs. Henry Sidgwick, and a decidedly interesting account, by M. Marillier, of certain apparitions of the Holy Virgin to peasants in Dordogne, which he studied on the spot. A somewhat neurotic shepherd girl, Marie Magontier by name, who saw the Virgin one day when by accident she peered into a crack at the bottom of an old ruined wall, seems to have been able to infect her whole neighborhood with the same visual hallucination, to which, later, others in the open air, as well as auditory hallucinations, were added in some of the subjects concerned. In the earlier days of the Church this would doubtless have made a first-rate miracle. At present the local priesthood is inclined to treat it as pathological. The possibility of collective hallucinations such as these probably throws light on the testimony in some old witchcraft epidemics. The part

played by the dark cavity in the wall is probably analogous to that which the crystal plays in "crystal-gazing," where dimly luminous appearances seem to stimulate the visual "centres" to abnormal activity. We understand that the American Branch of the Psychical Research Society is not yet self-supporting, and would be glad to enlarge its membership. Persons interested can apply to the Secretary, Mr. Richard Hodgson, of No. 5 Boylston Place, Boston, Mass.

—Prof. White's paper in the 'Harvard Studies in Classical Philology,' which has been printed separately in pamphlet form, has a particular interest, since it discusses in a very careful manner the question of the stage in Aristophanes—that is to say, the literary evidence of the plays themselves with regard to Dr. Dörpfeld's theory repeatedly referred to in this journal, and set forth once more by Mr. White himself in his recent communication on the Theatre at Megalopolis. His investigation issues in the conclusion that "the Comedies of Aristophanes could not have been performed on the stage of Vitruvius"; he adds the positive suggestion that the Comedies can be "set" with great ease on the supposition that there was no barrier of a raised stage between the actors and the chorus, and this in itself furnishes a strong argument in favor of the theory. There is a great deal of "stage business" in the Comedies, and Aristophanes is ingenious and fertile in devising farcical situations in which both actors and chorus take part and mingle apparently on the same level. More than a score of such situations occur, in eleven of which, on the old theory, the chorus are on the stage, while in the remainder the actors are in the orchestra. If we read the plays without prepossession in favor of a stage, these situations are easily conceived and easily "set"; they are often much more telling. If we assume the existence of a stage, we are sometimes obliged to explain away the obvious sense of the poet's language, and we are left in perplexity as to what was the exact nature of the action. This perplexity was felt in one case even by the Greek scholiast on "The Frogs." The situation is this: Dionysus, wandering in Hades, is greatly alarmed by his attendant's highly imaginative description of a hobgoblin, and in his fright appeals to his own priest to preserve him. Now the priest of Dionysus sat in the centre of the front row of spectators, and the scholiast asks: "How could the actor go round from the stage and hide himself behind the priest? It appears that *the actors were not on the stage, but in the orchestra.*" This is a very interesting concession made to the apparent necessities of the action by an ancient commentator, who nevertheless believed that Aristophanes used an elevated stage. There are three similar passages, in one of which the actor flings his cloak among the spectators, in another he throws barley-corn to them, in the last he conducts a young woman, Theoria, among the front seats, praises her charms, which are very freely displayed, and palms her off on an official of the Senate, the Prytanis, who had the honor, with his colleagues, of a reserved seat near the circle of the orchestra. "Do you see," says the actor, "how eagerly the Prytanis took her from me?" Now, a pantomime of this piece of buffoonery at a distance of sixty feet from the functionary would certainly seem very flat and pointless. In all these cases the language implies that the action did take place as described.

—Various other situations are highly significant. Aristophanes had a fancy for closing his plays with a procession in which the actors and the chorus join. In several instances he makes a choral dance go on just in front of the scenery. If this took place on a stage, we should have twenty-four persons dancing on a platform six feet wide, for that is all we have left of the stage of Epidaurus after allowance is made for the "distegia." In the "Acharnians," we have from thirty to fifty "supernumeraries" on the stage, and benches must have been provided for half the number. There is great difficulty in "setting" such a scene on a stage so narrow; and we have no warrant for reducing the number of policemen, assemblymen, ambassadors, and so on to a mere representative handful—a Pyramus and Thisbe equipment—as is done by Mr. Haigh and others. In the "Peace" and the "Lysistrata" we have a nearly equal number on the stage, and some very lively action going on, if we are to judge by the conversation. There is no reason, Prof. White argues, why we should not take this language literally, and why the performance should not have been carried out in a "realistic" manner, except the necessities imposed by the assumption of a high and narrow stage. In more than a score of instances, then, the chorus and the actors are on the same level, and Aristophanes, who is very careful in motiving his situations, gives no hint that there has been a change of level. This must be admitted by those who maintain that in five passages the poet does indicate a change of level in the words "ascend" and "descend," used of actors (ἀναβαίνειν and καταβαίνειν). As to these crucial passages, Prof. White maintains that the words are here used as technical theatrical terms, surviving from the time of Thespis and the ἐλεός, or table, on which his single actor stood, and that in the time of Aristophanes these old-fashioned terms were retained with comic effect, simply in the sense of entrance and exit, without implying change of level. He quotes in defence of this interpretation the criticism of one scholiast on another in the "Knights," line 149. The words "ascend" and "descend," it should be noted, are used in these passages only of actors, never of the chorus. More than a dozen other words used in the Comedies of entrance and exit imply no change of level. The details of the facts and arguments are naturally more striking and impressive than this brief summary. Mr. White recognizes, accordingly, three periods in the history of the Greek stage: "The earliest time, when the actor stood on the ἐλεός; the classical time, when he stood on a level with the orchestra, in front of the proscenium; the Macedonian epoch, when, with the loss of the chorus and the general vitiation of the public taste, he did doubtless stand upon it [*i. e.*, the proscenium transformed into a stage]." Of this second period the scholiast had no knowledge; neither, apparently, did Vitruvius the architect, nor Pollux, the antiquarian.

—Some attention having been aroused by the absurd exploit of Mr. Calderon in painting St. Elizabeth of Hungary naked before an altar, in presence of Conrad of Marburg and some friars, our readers may possibly feel an interest in the text which Mr. Calderon has thus rendered so literally. It occurs in Theodoric of Thuringia's 'Life of St. Elizabeth,' Lib. vi., cap. i., and runs as follows:

"Die autem parasceve dum pro mysterio et memoria Salvatoris pro nobis nudi nuda cruce pendentis altaria nuda apparerent, Magistro Conrado et quibusdam de prædictis fratribus præsentibus, in quadam capella ponens super nudum altare manus sacras, voluntati propriæ, parentibus, liberis, et cognatis, omnibusque hujusmodi pompis renunciavit, imitatrix Christi, et omnino se exuit et nudavit, ut et nuda et nudum paupertatis et charitatis gressibus sequeretur."

In view of the applause with which the picture was greeted, and its purchase by the Chantrey Fund as a worthy representative of British art, it is easy to understand the indignation in Catholic circles at so indecent a travesty, which outrages all the traditions of saintly modesty. It is not so easy to comprehend how any artist should be so utterly lacking in imagination and in a sense of fitness as to misconstrue the evident meaning of the chronicler.

—The collection of the folk-tales of England and Ireland has been so long neglected that it is doubtful whether in the former country there is much left to gather, and the amount of material which has undoubtedly perished in Ireland must be very great. We have recently reviewed Mr. Jeremiah Curtin's 'Myths and Folk-Lore of Ireland,' which was a praiseworthy attempt to rescue this evanescent material, and now we have to mention briefly 'Beside the Fire: A Collection of Irish Gaelic Folk Stories,' edited, translated, and annotated by Dr. Douglas Hyde (London: David Nutt). Of the fourteen stories in the volume (there are some riddles also), seven have already been printed in the original Gaelic in the same author's 'Leabhar Sgeulaighteachta'; the rest are here given for the first time with the original text and translation. The stories have all been written down by the author himself or by some friend acquainted with Gaelic, and the names of the narrators and the locality are given with exactness, so that we have here the first really scientific collection of Irish tales. Very few of those contained in the present volume have parallels in the Scottish Gaelic tales published by Campbell and MacInnes; but this is due to the collector, who purposely chose tales which were dissimilar, and who says, "As a general rule, the main body of tales in Ireland and Scotland bear a very close relation to each other." Not many of the stories in Hyde have European parallels. The following are the most noteworthy: p. 3, "The Tailor and the Three Beasts," compare Grimm No. 20, "The Valiant Little Tailor," and Dasent, p. 36, "Boots Who Ate a Match with the Troll"; p. 19, "The King of Ireland's Son" is a mixture of Grimm No. 71, "How Six Men Got On in the World," and the theme of "The Thankful Dead"; p. 129, "The Well of D'Yerree-in-Dowan," compare Curtin, p. 93, "The King of Erin," etc., which has a parallel in Grimm No. 97, "The Water of Life"; and p. 148, "Neil O'Carree," which is composed of the theme of "The Thankful Dead" and the story first found in the 'Cento Novelle Antiche' ('Il Novellino'), and best known by the version in Grimm No. 81, "Brother Lustig." The collector has written an interesting preface, in which he discusses the relation between the folk-literature of Ireland and Scotland, and indulges in some mournful reflections upon the neglect with which the language and literature of Ireland have been treated. Mr. Alfred Nutt has written a valuable postscript to the preface, and appended a few notes to the various stories. Altogether, Dr. Hyde's volume is a valuable and welcome contribution to folk-lore, and we sincerely trust it will lead to a collection of Irish popular tales worthy to stand by the side of Campbell's priceless work.

FREEMAN'S HISTORY OF SICILY.

The History of Sicily from the Earliest Times. By Edward A. Freeman. Volume

I. The Native Nations: The Phœnician and Greek Settlements. Vol. II. From the Beginning of Greek Settlement to the Beginning of Athenian Intervention. Pp. xxxvi, 609; xx, 583. With maps. Oxford: Clarendon Press; New York: Macmillan & Co. 1891.

In the broadest retrospect, European history chronicles a tremendous conflict between the Aryan and the Semitic races. Compared with this conflict, which lasted more than five-and-twenty centuries, the local struggles among the Greek, Italian, and Teutonic tribes seem almost insignificant. The final question to be decided was, from the dawn of history, not which Aryan people should dominate Europe, but whether Europe itself should not fall under Asiatic sway and be deprived of even the possibility of developing an Aryan civilization. We do not sufficiently realize how near, in at least two crises, the Asiatic came to victory: had he won at Marathon, Salamis, and Himera, the course of ancient history would have been completely changed; had he won at Tours, there might have been no Frankish Empire, with feudalism and the other influences it bequeathed to modern times. In the first great onslaught Hellas was the champion of Europe; she defeated Darius and Xerxes on her own soil, and her Sicilian colonists defeated the Carthaginians—who were Semitic colonists in Africa—at Himera. Then followed the long duel between Rome and Carthage for the supremacy of the world. Triumphant Rome, blotting out her rival, made Africa and the East her tributaries, and it seemed as if the question were settled for ever—as if the Aryan were not only securely established in Europe, but also master of the men of Canaan. But when the Roman Empire crumbled, another Semitic wave poured westward; and, with wonderful rapidity, the Arabs swept along the southern coast of the Mediterranean, seized upon Sicily and Spain, and threatened to inundate all western Europe until they were checked by Charles Martel. Then Europe took the offensive, recovered Sicily, and, in the desultory and futile crusades, strove to regain the African seaboard and western Asia. Finally, just as the Arab power declined, Asia sent forth another brood of conquerors, the Turks, who made vassals of the Saracens, and, establishing themselves in the Byzantine capital on the Bosphorus, overran southeastern Europe and menaced Italy and Germany. Only two hundred years have passed since the followers of Othman encamped under the walls of Vienna; and since their defeat there, Europe has inch by inch driven them back, until but a fragment of their western empire remains to them. But the very presence of the Sultan at Constantinople is a reminder that the "eternal Eastern question" which perplexed the statesmen of young Hellas, is still unsettled. Asia no longer threatens to enslave Europe; but she has left a thorn in the side of Europe which no one dares to withdraw.

In this immemorial struggle between the East and the West, Sicily has played an important, often a most important, part. Her position as the stepping-stone between Africa and Europe, and as the wedge dividing the Mediterranean into two almost separate seas, predestined her to be the meeting-place and battle-field of the races. Though never a homogeneous nation herself, she has been involved in the affairs of many nations. Not only was she the pivot on which the struggle between Rome and Carthage turned, but also she has been the abode of Goth and Saracen, of Norman, German, and Spaniard; she has been the spoil of the House of Anjou and the House of Bourbon, and, finally, under the House of Savoy, she has been united to Italy. She is the most cosmopolitan of lands: on her soil all peoples have mingled to form a composite people in which Italian traits now predominate, mixed with traits inherited from Greek or Arab ancestors. No other island except Britain has had so eventful a history; but Sicily had already lived two lives, in the very centre of the world's conflicts, before Britain had a life that interested the world at all. Considering, therefore, the range and variety of Sicily's experience, it may seem strange that no one has hitherto written a first-rate history of Sicily. The reason, however, is obvious: the undertaking is almost too vast, requiring as it does a knowledge not only of what happened in the island itself during twenty-five centuries, but also of universal history throughout all that time. A complete narrative would include not only the deeds of Hiero and Hannibal, of Roger, Frederick II., and Garibaldi, but also a broad statement of the general currents of human progress so far as these influenced, or were influenced by, the fortunes of Sicily.

To supply this want has been for years the ambition of Prof. Freeman, and we have at last the first two volumes of his work, which he hopes to bring down to the time of Frederick II. He originally proposed to treat of Sicilian history during the Norman period, but in studying his material he became convinced that, in order to make mediæval Sicily intelligible, he must go back to the beginning; he felt that the real significance of the island's career comes from the part she played in that inveterate conflict between Europe and Asia to which we have briefly referred; and so, undaunted by the magnitude of the task, he set himself to write the history of Sicily from the earliest times, when fragmentary records disappear in myths and legends. The key to his treatment is found in this sentence, which he quotes from Grote (vol. v, p. 277):

"We are here introduced to the first known instance of that series of contests between the Phœnicians and Greeks of Sicily which, like the struggle between the Saracens and the Normans in the eleventh and twelfth centuries after the Christian era, were destined to determine whether the island should be a part of Africa or a part of Europe—and which were only terminated, after the lapse of three centuries, by the absorption of both into the vast bosom of Rome."

The scale on which Mr. Freeman works may be inferred from the fact that these first two volumes (of nearly 1,200 octavo pages) bring his narrative down only to the year B. C. 433; yet the authentic history of Sicily cannot be said to begin before the seventh century, and then it can be gathered only in scraps. Before the seventh century, and long afterwards, conjectures and myths are our only guides, to be confirmed by what hints archæology and philology can give. Of the aboriginal inhabitants of the island we know nothing; the first distinct tribes were the Sikans, who may have come from the Iberian peninsula; the Sikels, who seem to have been related to an early Italian people; and the Elymians, about whose origin even so expert a guesser as Mr. Freeman offers no plausible suggestion. Some time later than the eleventh century the Phœnicians made settlements on the northwestern shores of the island, and three of these settlements—Panormos, Motya, and Eryx—grew to be prosperous towns, which, in the seventh century, looked to Carthage, the great Phœnician power in Africa, for protection. In B. C. 735, the first Greek settlement was planted at Naxos by men of Chalcis, and in the following year, Corinthians founded Syracuse. Thenceforward, for more than two hundred years, the work of Greek colonization went on.

It was about B. C. 580 that the first recorded struggle between the Greeks and Phœnicians occurred, when Pentathlos led a body of Rhodians and Cnidians to settle on the western coast, and they were driven away by the Phœnicians. But not till a century later did the irrepressible conflict between the races come to a crisis. Then, when Xerxes massed all the power of Asia to crush Hellas, the Carthaginians sent their armies to aid their Phœnician brothers in overwhelming the sons of Hellas in Sicily. At Himera the contest was fought; the Punic host was routed, and Greek Sicily had a respite from barbarian aggressions during nearly three generations. During this interval, Syracuse and Acragas rose to the meridian of luxury and power, and several other cities fell but a little behind them. The early tyrants, Gelon and Hiero at Syracuse, and Theron at Acragas, enjoyed only a brief ascendancy; yet it was to them, and to their imitators elsewhere, that the Greek cities of Sicily owed the erection of many of those monuments whose ruins now attest the power and culture of that period. From B. C. 472 to B. C. 433, Sicily was free alike from native oppression and foreign interference, although would-be despots harassed her from time to time and there was more than one quarrel between city and city. By far the most interesting episode during these forty years was the unsuccessful attempt of Ducetius, a Sikel, to set up a Sikel kingdom. After him, the Hellenization of his tribe went on so rapidly that the Sikels themselves became one in interests and fortune with their Hellenic conquerors. Mr. Freeman's second volume ends, it will be seen, on the eve of the outbreak of the Peloponnesian war, the most dramatic and important of whose campaigns was to be waged in Sicily.

This first epoch is illustrated by the career of a few conspicuous men—of the tyrants above mentioned, of Phalaris and Empedocles, of Dorieus, Hippocrates, and Anaxilas—and Mr. Freeman has done well, in the absence of larger information about the people, to dilate upon these. The chief sources from which he could draw his facts, the works of Herodotus, Thucydides, and Diodorus, are often so scanty that he has also ransacked Greek poetry for every reference to early Sicilian affairs; and at least two Greek poets, Simonides and Pindar, have supplied him with material. That poetic side-lights are better than utter darkness, no one will deny; but we believe that the tendency of modern scholars is to overestimate the value for historical purposes of these poetic hints. If, in the far future, the only record that men possessed of Napoleon should be Manzoni's ode—if nothing were then known of Cromwell but Marvell's ode—historical students would doubtless attempt to reconstruct the history of Cromwell and Napoleon; but can we believe that their patchwork could contain more than those poems contain? Is it not time to be more wary of conclusions drawn from stray phrases in the classic poets—to suspect the solidity of an historic edifice based on the fragment of an ancient statue or a bit of pottery? We would not for a moment disparage the use of these and similar aids, but we would insist that their authority can be, at the most, only partial and corroborative. More than once, after the expert has restored a mutilated statue to the satisfaction of archæologists, the missing fragments have been unearthed, and have been found to differ widely from the "restoration."

We feel the want of caution in Mr. Freeman's work, especially his first volume, where facts are few and conjectures many. Indeed, without adding the most liberal supply of conjectures, no one could stretch the account of Sicily from prehistoric times down to the middle of the fifth century B.C. through nearly 600 pages: all the facts, together with a concise statement of the legends and theories, could be adequately told in a small fraction of that space. But Mr. Freeman does not sufficiently discriminate between the functions of the historian and the functions of the archæologist. He devotes much of his attention to the topography of the ancient towns; he describes those ruins that remain, and speculates as to the probable site of lost monuments and cities. He requires, for instance, two pages for stating that Sicily's shape is not exactly triangular, the western angle being somewhat blunted; he debates whether a town started at the foot of a hill and crept to the top, or started at the top and crept to the bottom; he dwells upon the probable changes in the harbor of Panormos. This is much as if we should find in a history of the United States a long and minute description of the Great Serpent Mound or of Dighton Rock. Temptations like these Mr. Freeman, in the case of Sicily, cannot resist. In proportion as a question is hazy, his attitude towards it is not, "What do we know about this?" but, "What can we infer?" This method causes an historical work to resemble those German editions of the classics in which five lines of text are an excuse for ten pages of comments. Let one case serve to illustrate many: less than two pages sufficed to Grote for stating all that is known about Phalaris; Mr. Freeman's discussion of Phalaris covers fourteen pages in the body of the work and an appendix of twenty pages in small type.

We lay stress on this subject because we believe that it involves the fundamental principles which should guide the historian. During the past half century there has sprung up a body of writers devoting themselves to that amiable fiction, "the science of history." They might as well pursue the science of prophecy; for if history were a science, in the strict meaning of the word, the historian would not only know absolutely all the motives and actions of men in the past, but he would also be able to foretell the future. But the most "scientific" historian in the world did not foresee on April 13, 1865, that President Lincoln would be assassinated within forty-eight hours; and who would have predicted two years ago the dismissal of Bismarck by the heady young Kaiser? The term "science," as we understand it, cannot properly be applied to human events in which the unexpected may at any moment upset all calculation. What is really meant by the "science of history" is that the historical student strives to sift evidence accurately, to state facts impartially, and to eliminate so far as he can the personal equation from his results; and he has been wonderfully assisted by the great advance made by the true sciences in recent times. A man may, however, succeed in all these endeavors without being a great historian. Mere accuracy and ability to heap up facts do not suffice; there must accompany these qualities imagination—the power to see through facts to causes—and the artist's power of classification and expression. A history is worth, at the last analysis, only as much as the historian's personality; it is not only a record, but a commentary; and whereas to a small man the most stupendous episodes seem small, to the great mind the smallest event is mightily significant. Long before the "science of history" was dreamt of, Thucydides wrote a history, and Tacitus another, which all the "scientific" historians in the world to-day would try in vain to equal. One characteristic of this modern school is to overburden their pages with erudition; another is the absence of imagination, of vividness, of charm. To the average "scientific historian" the past is a vast cemetery whence he abducts cadavers for dissection.

How far Mr. Freeman's adherence to the scientific method of writing—it would be more appropriate to say of *accumulating*—history has led him to cumber his work with matters which only indirectly bear upon it, we have already hinted. That he sees clearly the great currents of human progress is as evident as that he has not the gift of describing them in a master's fashion. He labors so hard to be precise that he has too little charm. He carries antithesis and repetition beyond all bounds. If such a sentence as the following seems rugged, "The gods were the gods of the netherworld, but their very nature as gods of the netherworld made them also gods of the high places" (i, 98), what shall we call this passage?

"The English settlement in Britain, with all that it was slowly to lead to in after ages, was not, at the time, an *advance* in civilization. In truth, as an *advance* of heathen destroyers, it was eminently the opposite. But the *advance* of the Greek over the Sikel was in every way the *advance* of the higher over the lower man. The English *advance* in America was so far more strongly. For the *advance* of the Greek against the Sikel was after all only the *advance* of European against European; it was the *advance* of kinsmen to whom the lamp had been first handed against kinsmen who had lagged behind them in the race" (i, 319-20).

Such a style might be excusable in a textbook of chemistry, or in the composition of a child who had not yet been taught the use of pronouns; but in an historical work which is to be read as literature, how can we excuse it? Mr. Freeman has so long been known as a spelling-reformer that it is hardly worth while to quarrel with him on that score now, but we may fairly ask that he be consistent. On one page we find *Aeschylus* and *Sophoklês*, on others, *Aristotle* and *Sokratês*; why this discrimination? Or, if we are suffered to write *Macedonia*, why are we forced to write *Epeiros*? But into the mysteries of classical spelling-reform we will not venture to intrude. The use of *æra*, *phœnomena*, *prae*-historic, etc., is a reversion to antiquated forms which, being unnecessary, seems pedantic.

It will be observed that our adverse criticism falls in the main on the method which Mr. Freeman has pursued—a method which, we believe, can never produce an historical work of the highest order. But we recognize and applaud the diligence with which he has gathered his materials, the breadth of his erudition, the patience with which he has examined every line and literally turned every stone that bore an allusion to his subject. And if the reader be disappointed because all this industry and learning have not created a vivid, terse, and charming history, he will nevertheless acknowledge that there is scattered up and down these two volumes, as in an encyclopædia, a vast deal of information concerning all things Sicilian as late as B.C. 433. And in the fifty-six appendices the specialist will find a further discussion of those moot questions in archæology and classical lore which to specialists are of more interest than the lives and deeds of men. It is to be hoped that, in the succeeding volumes, Mr. Freeman, having reached a period concerning which contemporary historians have left ample records, will devote himself to the swift and strong narration of events, leaving the critical exegesis of texts and the putting forward of conjectures to German students who excel therein.

A word should be said in praise of the make-up of these volumes. Each has a full table of contents, marginal rubrics, maps, and an index. The paper and press-work are excellent. It is a pity, therefore, that each volume should have several pages of corrections and additions, which might have been distributed in their proper places in the text. We have marked a goodly number of misprints not included in the list of errata, but we have no space to set them down here.

STRATMANN'S MIDDLE ENGLISH DICTIONARY.

A Middle English Dictionary. By Francis Henry Stratmann. New edition, rearranged, revised, and enlarged by Henry Bradley. Oxford: The Clarendon Press; New York: Macmillan.

THE appearance of a Middle English Dictionary, though but a new edition, is by no means insignificant. No period in our language history is more important for an understanding of present English, and none has been so lacking in those proper aids to study, grammars and dictionaries. The grammar of Middle English is yet to be written, the Chaucer Grammar of Ten Brink, invaluable as it is for the great part of the fourteenth century, being still inadequate for all periods, and for other dialects than the Midland. In the matter of dictionaries, the case has been worse. The great dictionary of Mätzner has not yet reached the middle of the alphabet. Stratmann's dictionary, last issued with supplement in 1881, left much to be desired, as must have been the case with the first work in so wide a field. Appreciating this, Dr. Stratmann had nearly completed a revision of his work in 1884, when his death occurred. It is this corrected edition which is now issued by the Clarendon Press, under the editorship of Henry Bradley.

The first question suggested on the issue in England of a new work connected with English philology, is, "How far does it take account of the results of philological research in Germany?" For it is a lamentable fact that in England not only have German methods been sneered at, but the indubitable results of the most painstaking and trustworthy investigation have often been wholly disregarded. It is a pleasure to note, therefore, that, in the book before us, British prejudice has not prevented using the latest work of German scholars, and largely on this account the new volume will be most important to the student of Middle English.

Some of the points of superiority over former editions of Stratmann are indicated in the preface. They are, a more exact definition of words, Stratmann having paid little attention to this; a strict alphabetical arrangement, except for one or two modifications easily understood; the marking of vowel quantity to a much greater extent than hitherto attempted; the revision of etymologies, and the addition of many words, especially those of Romance origin, so largely omitted by Stratmann. Even as to the unremedied defects of the former book, the editor disarms criticism by frankly acknowledging the advantage of a different course in many cases. Here may be

placed the failure to separate all doublets resulting from adoption of a word through two channels, as English *chase* and *catch*, *chatel* and *cattle*, *desk* and *dish;* the verification of all references and their insertion in manuscript spelling; the indication of Middle English open and close *e*, *o*, both long and short, and the separation of palatal *g* from the guttural and dental-palatal consonants.

The marking of Middle English quantity is not easy, but the attempt is to be heartily commended. Mr. Bradley's plan of marking in a different way the new long vowels, while perhaps not objectionable, is hardly necessary, since the lengthening conforms to fairly definite rules well known to students of the language, and the addition of the Old English word in most cases of Germanic origin shows clearly enough the original quantity. Some objections might be made to Bradley's statement of the laws of lengthening, since it is at variance in several particulars with that laid down by Ten Brink in his Chaucer Grammar, and that given by Kluge in the recently issued 'Grundriss der Germanischen Philologie.' Moreover, full account does not seem to have been taken of the later development of the language, as throwing light on Middle English quantity ; for it must be assumed that vowels whose later changes are wholly normal must have had in ME., or late ME. at least, the quantity of vowels in other words of the same category. To illustrate, the *i* of *climben* should be long, both because of the general rule that *i* is long in ME. before *mb*, *nd*, *ld*, and because in no other way could we account for our word *climb*. So the lengthening of *o*, open and close, before *mb* is evident from present English *comb*, *womb*, *tomb*, while in *lamb* the ME. word was long, though our word must have come from a form retaining its short *a*. Sweet even adds *dumb* to the list of words with long vowel before *mb*. Similarly, the lengthening before *r* + voiced consonant, while it may not have been universal, might better be marked in words which are distinctly separate in present English because of such lengthening. Examples are, *board*, *hoard*, *weird* (long in OE. even), and *beard*, the last of which is alone marked long by Bradley. Wholly unmarked are the lengthened vowels before *n* + palatal *g*, even when the modern forms show the quantity conclusively. Examples are *change*, *grange*, *strange*, *stranger*, *danger*, *manger*, *angel*—the last not from OE. *engel*, as implied by Bradley, but from the old French word. The recognized lengthenings of OE. monosyllables are usually noted, but *we* is given short, and our *thou* is marked both long and short. In some other cases there is lack of consistency. For instance, *hol* 'hollow' is short, while *col* 'coal' is long. In fact, both were long in ME., probably lengthened before the close of OE. times. So while vowels in open syllables of Germanic words are usually marked long, *beren* 'to bear' and *barin* 'to bare' among the *b's* are not marked, although the similar word *swerien*, 'to swear,' receives its proper length. Lengthening of *e* before *nd* is not marked, though both Sweet and Kluge give examples of it; and such a word as *taste* has long *a*, while *best*, 'beast,' is unmarked. In general, the quantity of originally unstressed syllables in Romance words is not indicated, although many of them had become long, owing to shifting of stress, as early as the fourteenth century. Following Stratmann, Bradley indicates the quantity of these words only in the earliest time.

But the most striking omission is in not indicating the difference between open and close *e*, *o*, long and short, at least so far as it is fairly evident from the later outgrowth of the speech. Mr. Bradley himself recognizes this by saying that the open *o* (long and short) "ought to have been used for Middle-English *o*, when representing an Old-English *a*" long and short. It is true such distinction would be pioneer work, like that of marking quantity, but it is to be regretted it was not begun in so good a book. Moreover, to one who looks upon language as a physiological development under determinate laws of sound-change, it is perplexing to see ranged side by side, without any indication of difference, words whose phonetic quality has been different at every successive stage of the language. For example, the separation of ME. open and close *ê* is by no means so difficult as it would at first seem. Both *ê*'s appear in modern English as *î*, with the spellings *e*, *ee*, *ie*, *ei*, *ea*. But until the eighteenth century words with *ea* were distinct from the others. A comparison with Old and Middle English shows that words spelled now with *ea* and having the *î* sound must have had open *ê* in ME., and that this alone can account for a distinction kept up for three centuries. The only exceptions are a few words with *ee* springing from open *ê* in early ME., which must as certainly have become close *ê* in late Middle or early modern English. It should be said that some indication of the quality of vowels is given by the editor in his retention of the early *œ* for open *ê*, but this should have been supplemented by the recognition of the close *ê* as well. The problem of marking open and close *o*, long and short, is even less difficult. Not only OE. long *â* became ME. open long *ô*, although sometimes retaining the traditional spelling with *â* in the earliest period, but words which show long close *ô* at present presuppose an open vowel in the ME. time. Examples are numerous, as our *stone*, *boat* from OE. *â*, and *gold*, *hole* from OE. short open *o* by lengthening in ME. The separation is the more easy because ME. long close *ô* has regularly become long *û*, as in *gloom*, *bloom*, *tooth*, *goose*, etc.

The palatal and guttural *g's* should have been separated also, since the palatal quality which precedes our *g* was almost, if not quite, as distinct in ME. as it has become in later times. The separation has been made in the smaller ME. dictionary of Mayhew and Skeat, besides being usual in glossaries. Bradley's introduction of German *ü* for the umlaut of OE. *u* represents, of course, the phonetic value of the umlaut in Southern English, but not in the Midland and Northern dialects, where the umlaut of *u* was constantly represented by *i*, showing it had become unrounded.

Without seeking for errors especially, some have been noticed which show carelessness at least in giving OE. words. Under *dust* the OE. word should have a long vowel, the *û* being for original *u*+*n*. Our *fever*, ME. *fefre*, should have long *ê* both in Old and Middle English, although unmarked by the editor in either case. It has been generally accepted also, that OE. *lytel*, "little," has a long vowel, as may be seen from Kluge's 'Etymologisches Wörterbuch,' or the OE. grammar of Sievers. Under *rechen* the OE. forms should be *rêcan*, *reccan*, not *rêccan*, cf. Kluge under *geruhen*. After ME. *stirôp* should be given OE. *stigerâp* if one follows Kluge, or *stîgrâp* as often, but not *stigrâp* with short *i*. The OE. word from which ME. *snare*, "snare, noose," is derived is *sneareh*, not *snear*, the two consonants *rh* alone accounting for the breaking *ea*. In giving OE. words there is no distinction between original *e*, and *e* the umlaut of *a*, nor is there recognition of OE. dialectic forms. It would have been comparatively easy to give West Saxon forms in all cases, or to have indicated dialectic peculiarities.

It is not to be expected, perhaps, with our present knowledge of the subject, that all etymologies in such a work should be correct, but we are surprised to see the too common English reference of our word *silly* to OE. *sælig*, ME. *sæli* 'happy,' instead of to OE. *sellic* 'odd, peculiar.' The two words were distinct as late as Spenser's time at least, if they ever fell together. Similarly there is no separation of OE. *engel*, and OF. *angel*, from which alone our *angel* could have come. There is little reason also to connect *early*, ME. *ærlich*, with Icl. *ârligr*, rather than with OE. *ærlice*, notwithstanding the theory of Ten Brink that the adverbial ending *-ly* has been influenced by Icl. *-ligr*. So it is highly improbable that *trout* could have come from OF. *truite*, while it would be a natural outgrowth of OE. *trâht*. In most cases, also, the modern English phonetic equivalents are given, even when the word has changed its meaning, but sometimes these are omitted when we should expect them. Under *runien* 'to whisper' should be given English *round*, marked obsolete in our dictionaries, but used by Browning in the 'Ring and the Book' and other poems. So, too, under *gure-blôd* should be mentioned the word of similar meaning used by Shakspere, *gore blood*, "Romeo and Juliet," iii., 2, 56. Without doubt the words are the same, the ME. *u* being (as often) for a close *o*, and in this case the word belongs under *gôre*. There seems to be a curious mistranslation of a Latin definition in one of the glosses. ME. *stert*, our *start*, is rendered 'start, moment,' where *moment* translates Latin *momentum* 'a movement.'

Notwithstanding these criticisms, it remains to say that we have in this volume a much better book than the original Stratmann, more exact, more complete, more useful. Its issue by the Clarendon Press is a guarantee of almost perfect typography, and, by abbreviating the references where possible, the book, with its added material, has been made no larger than the original dictionary.

The Right Hon. Arthur Macmurrough Kavanagh. Compiled by his cousin, Sarah L. Steele. Macmillan & Co. 1891.

FREQUENTERS of the streets of Dublin, visitors to the lobby of the House of Commons, between 1866 and 1880, must at one time or another have been attracted by the spectacle of a noble head and presence being carried in the arms of an attendant from carriage to door, or from lobby to a back seat. There was something wrong—the being had no limbs—yet no painful impression was given. It appeared for the moment not so much that something was wanting to him as that ordinary men were endowed with unnecessary appendages. This being was Arthur M. Kavanagh, the subject of the biography before us. We doubt whether there ever was a greater instance of a man triumphing over physical disabilities. If he had been the child of poor parents, he would doubtless have lingered out his days by the fireside or in the wards of a charitable institution. Born of one of the oldest and wealthiest Irish families, the direct descendant of Dermot Macmurrough who brought over Strongbow and his Norman knights, he was given every advantage, and, with the aid of appliances, became a fearless rider, a keen sportsman, and an enthusiastic yachtsman. He travelled Europe and India, often enduring privations that would wear down men of robust constitution. Naturally

of a religious temperament, his cheerfulness was admirable and unfailing.

Still more remarkable was the manner in which he threw himself into public affairs, local, Irish, and Imperial. For many years he stood out as perhaps the ablest of the ascendancy party in Ireland. He was considerate and humane to all around him. He believed the Irish people were essentially unfit for self-government, but that they should be well and honestly governed. As a magistrate he was wont to dispense justice and administer advice from a seat under an old oak tree near his hall door. Thus he and his should dispense justice to the masses of their fellow-countrymen. He sat in Parliament from 1866 to 1880. A Protestant, he represented a constituency in which the Catholics were to the Protestants as 8 to 1. A landlord drawing his wealth, and means for foreign travel, and keeping up his yachts and placing his children in high positions, largely from the power to screw up the rents upon tenants in proportion as they delved and saved, his constituents were those very tenants. He voted to rivet the support of the church of the minority upon that of the majority; he resisted all efforts for effecting land reform. In the elections of 1880 the people, armed with the ballot, threw off the representation of such men. This he and his biographer regarded as the basest ingratitude—as a conclusive proof of the unworthiness of the people and of their weakness in being led by interested agitators.

Mr. Gladstone's measures of land reform accomplished, it is to Kavanagh's credit that he accepted the inevitable, and recognized that the only safety for his class thenceforward lay in the widest extension of peasant proprietorship. Needless to say, he was an opponent of home rule, an ardent admirer of Mr. Balfour. Under different circumstances he might have become a prominent leader in Irish affairs; as it was, he could only be an advocate of the maintenance of the rights of a class.

The biography before us is unduly laudatory, and is often wanting in balance. It is, upon the whole, interesting, and has its value as a witness to the extent to which man can triumph over bodily failings and maintain a cheerful, healthy spirit. It is also of worth as an exposition of the ideas and the hopes of the class to which Mr. Kavanagh belonged. We are left in doubt as to whether the numerous mottoes in ancient and modern languages at the heads of the chapters indicate the learning of the subject of the memoir, or imply the erudition of the authoress.

Optical Projection: A Treatise on the Use of the Lantern in Exhibition and Scientific Demonstration. By Lewis Wright. Longmans, Green & Co. 12mo. 1891.

MR. WRIGHT'S excellent work will assuredly be warmly welcomed by teachers and lecturers. In it the subject of what may be termed illustrative projection is reduced to purely scientific principles, while its capabilities are developed and largely extended. In this country lectures are, as every one knows, very frequently and often very advantageously illustrated by optical projections upon screens, and the lantern has become a popular instrument. It is important to give it the highest degree of perfection, and this can only be done by a thorough study of the optical principles upon which its construction rests. Mr. Wright's work gives all that is, at present at least, necessary. It contains the theory and practical construction of the lantern itself; an account of the different sources of light, and of screens and accessories of all kinds. We have then accounts of apparatus necessary for scientific demonstrations and their application to Physiology, Chemistry, Sound, Spectral Analysis, Light, Heat, Magnetism, Electricity, and finally to Scientific Diagrams. The book is very full of useful details, and is eminently practical. We notice no errors of moment, but may in correction state that the invention of the vertical lantern described on page 167 is due to Prof. J. P. Cooke of Harvard University.

HENRY HOLT & CO., Publishers, New York.

Coast of Maine.

CAPE ROSIER.

The lands of the "Cape Rosier Associates" on Penobscot Bay, 50 miles nearer Boston and the West than Bar Harbor, Mt. Desert, are offered for sale in parcels of five and ten acres and upwards. These lands comprise over ten miles of almost continuous shore-frontage in one of the boldest and most beautiful sections on the coast, twelve hours' journey from Boston. They front upon fine harbors, have beautiful rocky shores, beaches, woods, and mountain views. The drives along the shores and among the hills are very varied and beautiful. New wharves have been built, and new connections with daily trains and steamboats established. In these lands is offered an exceptional opportunity to purchase for very small sums fine and perfectly protected seashore estates. The lands will not be sold for speculation or in small lots.

ALFRED BOWDITCH, HENRY PARKMAN, J. MURRAY HOWE, } Trustees.

27 School Street, Boston, Mass.

Robert Browning.

Life and Letters of Robert Browning.

By Mrs. SUTHERLAND ORR. With a New Portrait of Mr. Browning and a View of his Study. 2 vols., crown 8vo, gilt top, uniform with Browning's Works, $3.00.

Mrs. Orr is the authorized biographer of Mr. Browning. This work has been prepared with the sanction and aid of his friends.

Browning's Works.

Riverside Edition, from the latest English Edition. 7 vols., crown 8vo, gilt top, $11.25; half calf, $20.00.

Exhaustion.

HORSFORD'S ACID PHOSPHATE.

The phosphates of the system are consumed with every effort, and exhaustion usually indicates a lack of supply. The Acid Phosphate supplies the phosphates, thereby relieving exhaustion and increasing the capacity for labor. Pleasant to the taste.

Dr. A. N. KROUT, Van Wert, O., says: "Decidedly beneficial in nervous exhaustion."

Dr. S. T. NEWMAN, St. Louis, Mo, says: "A remedy of great service in many forms of exhaustion."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION: Be sure the word "Horsford's" is printed on the label. All others are spurious. Never sold in bulk.

F. Warne & Co.'s List

Casati's 'Ten Years in Equatoria and the Return with Emin Pasha' is now ready in two handsome 8vo volumes, with illustrations and maps.

Price, $10.00 per set.

The New Cookery Book. In crown 8vo, cloth. $1.75.

Practical Household Cookery.

Containing 1,000 Original and other Recipes. By E. DURET, ex-Manager of St. James Hall, etc.

'Practical Household Cookery,' while being comprehensive and complete, offers something novel in the variety of its savory dishes, Italian cookery, macaronis and rices, etc.

"The directions are simple and intelligible; the variety of recipes is charming and enormous; the dishes, their garnishing, their concoction, are all set forth with such clearness that even a maid-of-all-work can grasp the writer's intention. We used to give our dinner-parties at the 'club,' but since we have obtained Mr. Duret's 'Household Cookery,' we entertain at home."—*St. Stephen's Review.*

"Perhaps the strongest points in the book are those relating to soups, gravies, and macaroni. No expert *chef* who wants directions about these preparations should be without this book."—*Hotel Register.*

Now ready, in 12mo, cloth, $1.00.

JOHN RUSKIN: HIS LIFE AND TEACHING.

By J. MARSHALL MATHER. *Third Edition Revised.*

This volume is not a criticism, but simply an outline of Ruskin's life and teaching, intended for those who purpose a careful and detailed study of his works.

In the Chandos Classics, in two volumes, "Library" style, linen boards, $1.50; or "Roxburgh," gilt tops, $2.00 per set.

Memoirs of the Life of Sir Walter Scott, Bart.

By J. G. LOCKHART.

Revised and condensed by omitting the extracts from Scott's prefaces, portions of the reviews and letters not strictly biographical, and a few minor portions of the diary.

Now Ready, 12mo, cloth, $1.25. An entirely new edition (the sixth) of

Food and Feeding.

By Sir HENRY THOMPSON, F.R.C.S.

Sir Henry Thompson, besides being one of the leading London physicians, is also a most graceful writer. The above book is at once a delightful, gossipy companion, and a learned and exhaustive treatise on dietetics and the *cuisine*, and probably contains Sir Henry's final corrections and revisions.

Of all booksellers, or mailed free, on receipt of price, by the Publishers,

3 Cooper Union, New York City.

BEST ART AT SMALLEST OUTLAY.

Signed artists' proofs of the best Etchings, costing with tasteful frame from $10 to $80. Frederick Keppel & Co. of Paris, and 20 East Sixteenth Street, New York, have just issued their illustrated Descriptive Catalogue (No. 8). It will be mailed on receipt of 10 cents in postage stamps. Also high-class Water Colors. Visitors are always welcome to call and examine these pictures.

HOUSE IN CAMBRIDGE, MASS., for rent, unfurnished, if not rented furnished by certain date. Very desirable for family having members in Harvard University, the Annex, or in Cambridge Schools. Contains 14 rooms (including 8 bedrooms), library of 1,000 volumes, billiard-table, &c., laundry, and all modern conveniences; open fireplaces, and andirons for wood or portable coal grates. Near Brattle and Craigie Streets and Longfellow's house; street-cars to Boston close at hand.
Address, 8 Mercer Circle,
Cambridge, Mass.

Carbolate of Tar Inhalant.

Catarrh, Deafness, Bronchitis, Consumption, Asthma, cured at home. New pamphlet and full particulars free. Address, naming this paper,

The Nation.

NEW YORK, THURSDAY, JUNE 4, 1891.

The Week.

THE publication of the last batch of Bering Sea correspondence shows simply that Mr. Blaine received from Lord Salisbury about the 28th of February a despatch agreeing, with a few unimportant modifications, to Mr. Blaine's proposed plan of arbitration; that Mr. Blaine made no acknowledgment of this, and took no notice of it until about the 1st of April (Sir Julian Pauncefote says "a few days" before April 7), when in a conversation he proposed that a *modus vivendi* restricting seal-killing should be arranged pending arbitration; that Sir Julian expressed disappointment at not receiving along with this proposal an acceptance or rejection of Lord Salisbury's proposal of February 21; that this led to some mutual correction and recrimination; that May 4 Mr. Blaine revealed his *modus vivendi*, but still gave no answer on the plan of arbitration; that on the following day Sir Julian accepted the *modus vivendi*, which simply stops seal-killing this season, except 7,500, which the North American Company are to be allowed to take to meet the expenses of their establishment on the islands, and enable them to fulfil the obligations towards the natives imposed on them by their contract with the Government; that since May 5 there has been delay, owing to the need on the part of the British Government of communicating with Canada, and to Sir John Macdonald's illness, but that on June 1 Lord Salisbury was able to present to Parliament the bill now pending giving the British Government power to carry out the *modus vivendi* in Bering Sea. It will be seen that it is owing to Mr. Blaine that the arbitration scheme is still in abeyance four months after it was substantially agreed on, and that Lord Salisbury has been tardy in accepting the *modus vivendi* because in the first instance it came to him separate from the plan of arbitration, and with the plan of arbitration pushed back into the region of uncertainty, and in the second because he has had to consult the Canadians. However, the *modus vivendi* really carries the negotiations an important step forward, for it is an implied abandonment of all the old weapons of the controversy—the *mare clausum*, the hundred-mile limit, the "bonos mores," and so forth. The seals will by it be placed under the protection of the contiguous Powers, and saved for the present at least from Elkins, and we congratulate the poor beasts most heartily thereon. The slaughter of 7,500 seems, if slaughter there must be, not unreasonable, in view of the permanent obligations of the company on the islands, and we trust there will now be a final settlement of a controversy which in places savored greatly of the ridiculous.

John Bardsley, the City Treasurer of Philadelphia, who had $930,000 of the State's money and $600,000 of the city's money in two of the collapsed banks, and who speculated with it also and drew 4 per cent. interest on it for his personal profit, is in jail as an embezzler and misappropriator of public funds intrusted to his keeping. It is said now that he was known to have been a dishonest man for years, and to have been charged with forgery twice, before he was selected by the Republican managers of Philadelphia for City Treasurer. No one can be surprised to hear this. Qualifications of that kind are no novelty in Pennsylvania politics. Quay had similar ones, and his use of them in office, which was fully exposed, did not prevent his election to the United States Senate. Delamater had similar ones also, and his possession of them did not prevent his nomination for the Governorship, nor the support of him for that office by all the leading organs of his party. Everybody who opposed his election was denounced as an enemy of protection to American industry, and as an agent and worker for British free trade. Pennsylvania was spared the shame and the fruits of Delamater's election, but Philadelphia's bankrupt treasury indicates what the fruits might have been if the "agents of British free trade" had been less energetic.

The Chairman of the Prohibition State Committee of Pennsylvania has sent a protest to Gov. Pattison against the new ballot bill, asking him to veto it—

"(1.) Because one provision of the bill denies citizens of the Commonwealth the freedom in nominating, and, hence, voting for, candidates by any party name for public office, unless such nominations are first attested by 3 per cent. of the total vote at the previous election.

"(2.) Because, by another provision, no nomination for any office can be recognized and placed on the official ballot, or counted or returned, unless said nomination shall first have been petitioned for by one-half of 1 per cent. of the total vote.

"(3.) Because another provision requires that certificates of nomination shall be filed with the Secretary of the State fifty-six days before election and nominating papers forty-nine days before election."

Two of these are reasonable objections, and, if they represent the provisions of the bill accurately, are strong enough in our estimation to justify a veto. The 3 per cent. of total vote required for a regular party nomination is the same as is required by the Massachusetts and some other laws. In New York only 1 per cent. is necessary. This feature of the bill is not objectionable, therefore. The second objection is a very different matter. All existing ballot-reform laws state precisely the number of signers necessary to petitions for State and minor offices, but few or none of them give so large a number as one-half of 1 per cent. would be. That is, in fact, a prohibitive requirement, and would be found so in practice. The same thing is true of the requirement, stated in the third objection, of 56 and 49 days previous to election as the latest periods in which nominations can be filed. There can be but one meaning to these provisions, and that is, that they were put into the bill to make practically impossible the nomination of third-party and independent tickets.

The election in Massachusetts last fall resulted in the choice of a Republican House of Representatives, a Senate equally divided between the two parties, and a Democratic Governor. This Legislature should reapportion the State for Congressmen on the basis of the census of 1890, and the political conditions were such as to invite the passage of a measure which should be fair to both parties. The Republicans generally agreed that a non-partisan scheme of redistricting should be carried through, and a committee of the House was appointed which in due time reported a bill satisfactory to all candid men. Under its provisions the Republicans would carry eleven of the thirteen districts on the basis of the Presidential vote of 1888, and seven of the thirteen even in a "tidal wave" year like 1890. The better class of Republican newspapers throughout the State approved the plan, and everything promised its ready acceptance by the Legislature, when that "Scholar in Politics," Henry Cabot Lodge, and that lecturer of gerrymandering Democrats, the Boston *Journal*, called a halt, and insisted that the fair and non-partisan scheme should be dropped in favor of what the Republican Chairman of the Redistricting Committee pronounced "the most outrageous gerrymander ever proposed." Mr. Lodge went to the State House and lobbied to secure the passage of this bill, designed primarily to benefit himself by reaching out to bring some more Republican towns into his close district; but, fortunately for the cause of public decency, he was defeated, enough fair-minded Republicans in the House voting on Thursday with the Democrats to give the Committee's bill a good majority.

The Norwich (Conn.) *Bulletin* (May 21) announces that the great lock factory in that city, employing (according to the last report of the Norwich Board of Trade) 275 workmen, has determined to withdraw from New England and move its whole establishment as speedily as possible to Roanoke, Virginia. This involves a probable withdrawal of population from Norwich of from 1,000 to 1,200 taxpayers, consumers and good citizens, whose places it will not be easy to supply. The reason assigned for this action by the *Bulletin* is that the company may obtain cheaper supplies of pig-iron, brass, and coal; but it takes very good care editorially not to tell its readers and the people of Connecticut that, if it were not for the exorbitant tariff taxes which Pennsylvania has been mainly instrumental in imposing and defending, pig-iron, steel, brass, and coal could be supplied at their own doors as cheap as in

almost any manufacturing locality in the whole world—certainly as cheap as in any one of the great competitive centres of the metal industries of Europe. And under such circumstances there would be little thought or occasion for any metal-manufacturing establishment emigrating from Norwich or Connecticut, but a good deal of temptation and inducement for such industries to move in. During the last Congressional election this destructive influence of the tariff in general, and especially the influence of the McKinley Bill on the manufacturing interests of Connecticut and New England, was made a prominent feature of the canvass of this section of the country. It was presented by one of the candidates in Connecticut —Mr. David A. Wells—with a wealth of illustration and power of argument that could not be surpassed. His protectionist and Republican opponent attempted no serious reply, but on the contrary took great credit to himself for his votes in support of the highest and most unwarrantable protective duties on raw materials, and avowed his purpose, if elected, to continue to follow the same policy. The people of the district in which Norwich is situated elected him, and so endorsed his sentiments and approved of his votes; and now, we fancy, they are likely to appreciate practically the fruits of such policy, and also the point of the proverb about the class of people who will learn only in the school of experience.

The *Banking Law Journal*, in its last issue, publishes in full the Court of Appeals decisions upon the Bedell forgeries, declaring that the bank of deposit must make good the losses caused by the unauthorized payments. Genuine checks were made out to fictitious or real persons as the case might be, the endorsements were forged by Bedell, and the checks cashed through some bank by an accommodating friend. Aside from the legal points involved, the *Journal*, on behalf of some of our bankers, thinks that the common sense of mankind will pronounce the decision inequitable, since it puts upon banks a danger which they did not agree to assume, namely, that arising from the negligence of the drawers of the checks. That the plaintiffs led the banks into this danger there seems no doubt, and if the losses could be settled on a percentage basis, commercial equity might demand that a portion should be borne by the office from which the checks with forged endorsements proceeded. But this is not the case presented. The question is, Upon whom should the chief responsibility be laid? To this the business community will have but one answer: Upon the bank which paid the money without authority. The whole system of banking in the United States, and the established customs of trade, depend upon the principle that evidences of debt are payable only to the persons named therein. To weaken this principle would tend to destroy confidence, and would in the end be bad for the banks themselves. If a merchant, under our present conditions, should be distrustful whether money made payable to a particular individual would ever reach the right person, and whether, if it did not, he would have to pay the sum over again, that business man might think his own vaults safer. It is well to remember how important to the community is the office of a bank in collecting capital from one man to lend to another. Anything which looked towards lessening the security of deposited money, or its proper payment on demand, would, so far as it went, impair this service of a bank to the public. The Court of Appeals, in declaring the bank liable for payments to unauthorized parties, has followed a long line of judicial precedents, which have increasingly tended towards a more strict interpretation of a bank's responsibility, rather than the reverse.

It may be true, as a matter of law, that where two parties "equally innocent" have been the victims of fraud, the loss ought to fall on the one whose act set the fraud in motion. But the public cannot, in its own interest, agree to this doctrine, without stipulating that not only shall the parties be equal in "innocence" but in all other things. They must, that is to say, be equal also in special responsibility. It was wrong of the law firm in this case to intrust its checks to Bedell, but it was not its special business to keep Bedell from forging checks or to keep in constant readiness machinery to prevent fraud on the part of confidential clerks. The public looks to law firms for advice, for the conduct of litigation, and for the examination of titles to certain kinds of property. It looks to them only incidentally and for short periods for the safe custody of money. We presume that if lawyers were not allowed to handle the money of clients at all, their business might go on very much as it does now, and whatever service they render to the public be rendered with as much efficiency and fidelity as at present. Their custody of funds is something gratuitous, like a banker's reception and forwarding of travellers' letters.

In the *Forum* for June, President Walker gives a most instructive and judicial survey of the present situation of the census controversy, in an article entitled "The Great Count of 1890." After pointing out the reasons for pride in the wonderful achievement of the American people in overspreading with their population and with the agencies of civilization so large a portion of this great continent, and calling attention to the desirability of awakening a popular appreciation of the importance of these great decennial enumerations, he mentions the different bases upon which criticisms of a census can stand. These he divides into three classes: inaccuracy in particular localities, shown by recounts or by actual individual cases of omission; internal evidence of inaccuracy, supplied by nonconformity in results furnished by the census itself with inferences irrefragably deduced from other data contained in the same census; and finally non-conformity of the general result of the census with conclusions derivable from the series of preceding censuses. Of the first class, in the case of the eleventh census, the only important instance, according to General Walker, is that of the city of New York; as between the police and the national census, he considers conclusions doubtful, while he distinctly blames the national authorities for not having themselves undertaken the renumeration. But in any case an error in New York would not of necessity involve any conclusion concerning the general character of the census; and President Walker accordingly turns to the consideration of the comparative rates of increase in successive decades. Here, however, while his presentation of the subject is most interesting and instructive, he refrains from entering at any length into that portion of the question which, as he himself states, furnishes "the real *gravamen* of the hostile charges" against the census, viz., the vastly increased immigration of the decade. His reason for not doing so, while perhaps inadequate, is sufficiently distinct and scientific, as will appear from the concluding sentences of the article: "If the birth-rate among the previously existing population did not suffer a sharp decline coincidently with that enormous increase of immigration, and perhaps in consequence of it, the census of 1890 cannot be vindicated. To ascertain the facts we must await the tabulation of the population by periods of life, and ascertain how many of the inhabitants of the United States in 1890 were under ten years of age." It would have been interesting if so accomplished a statistician as General Walker had estimated, in advance of the facts, how "sharp" the decline in the birth-rate would need to be in order to justify the result of the eleventh census.

The Bradstreet Company has issued a very interesting pamphlet giving statistics about mercantile failures and their causes in 1890. It appears that there is one strictly commercial or industrial establishment in the United States and Canada to each seventy inhabitants. Out of this number 12,299 failed last year, a failure being defined as resulting in loss to creditors, and no account being taken in these figures of failures where the losses fell solely on the principals. Of the failures as thus defined, 90 per cent. were of concerns whose capital was less than $5,000 each. When it is recognized that out of 1,063,000 traders reported, about 903,000, or 85 per cent., are credited with less than $5,000 capital each, it has special significance that 90 per cent. of the failures are from this class: one in each 75 of these small traders fails each year. This large proportion of failures among the small concerns seems to indicate two things — one, the characteristic ambition and energy of the American people; the other, the bad effects of zeal without knowledge. To show the matter more clearly, tables are given which set out the causes of

failures in detail. More than four-fifths of all who failed in business in the United States in 1890 (82.3 per cent. in number owing 62.7 per cent. of the total liabilities) did so, primarily, because of lack of equipment, either natural or acquired, either mental or financial.

The Philadelphia *Record* states that "cattle will hereafter be shipped by weight on the Pennsylvania Railroad to prevent crowding." We have no doubt that this is the end which crowns the work of Mrs. Caroline E. White of Philadelphia. Her labors in "championing the cause" of cattle, so often cruelly treated while in transit from the West, were detailed in a report made at the last annual meeting of the American Humane Association, of which she is a prominent member. Suspecting that the United States statute, which requires that cattle in transit be watered, fed, and rested once after every twenty-eight hours of consecutive travel, was being broken by the Pennsylvania Railroad, she personally obtained money to hire an agent to go over the road and ascertain the facts. Having thus obtained evidence of violations of the statute, Mrs. White called upon the officers of the railroad and threatened them with a suit. She obtained from Mr. L. M. Prevost, the General Superintendent of Transportation, a promise that the schedule of the trains should be so arranged that in future the provisions of the law would be complied with. Mrs. White was, at the time, hardly satisfied with this promise. She was very anxious to induce the Pennsylvania Company to change their ordinary cattle cars into compartment cars. The obstacle to this was the opposition of the owners of the compartment cars. They, she states, are "so desirous to keep the renting of these in their own hands that they do everything to dissuade shippers from using the same kind of cars when provided by the railroads." The shipping of cattle by weight, instead of by number, seems to be another way of reaching the end Mrs. White has had in view.

While most of the immigration from the Dominion of Canada into New England is of the French race, there is a large element of English-speaking people from the Maritime Provinces. A reunion of Province people was held in Boston the other evening, at which New Brunswick, Nova Scotia, and Prince Edward Island were represented, banners symbolizing the different counties in the respective provinces being erected so that the large company might know in what parts of the building to find old-time friends. A correspondent of one of the Provincial papers, speaking of the reunion, writes: "We have plenty of ministers, doctors, and lawyers, provincialists by birth. No less than thirty-six of the ministers in Boston were born in the Maritime Provinces. Indeed, there is one county in Nova Scotia that claims to have but two products—lumber and Baptist ministers." Not a few of these people are the descendants of men and women who lived in New England generations ago before the Revolution, but fled to the Provinces during the war because they were Tories and sympathized with England. The reappearance of this element in New England a century later is one of the most curious phases of the migration of races.

The first Sunday opening of the Metropolitan Museum demonstrated that there was a real popular demand for the change, and that the new policy will prove fruitful of good results. There was a great crowd, composed almost entirely of people who cannot visit the Museum on week days, and "everybody was well-behaved and quiet." The instant success of the experiment here only accords with the invariable rule in other cities. The last annual report of the Cincinnati Museum Association says upon this point: "During the year 1890 the Museum was visited by 31,153 persons, of whom 15,993 came on Sunday afternoons. The attendance during 1889 was 21,287, of whom 3,917 came on Sundays. The gain over 1889 is, therefore, about one-half, and on Sundays alone. This was due to the lowering of the charge for admission on that day, referred to in the report of the Trustees. The character of the visitors on Sunday and the interest shown by them in studying the collections, seem to warrant the conclusion that the most effective part of the work of the Museum in art education is being done on that day."

When Count Taaffe dissolved the Austrian Reichsrath in January last, after the declared failure of his attempt to "reconcile" the Germans and Czechs, it was supposed that the new House of Deputies would supply him with a working majority, to be secured chiefly by a coalition of Germans and Poles. It now appears, however, that the task of welding the warring parties and fractions of the new Reichsrath into a safe Government majority is altogether beyond the power of the Austrian Premier. This was strikingly revealed in the recent proceedings of the Lower House when the question of adopting the usual address in reply to the speech from the throne presented itself. Three distinct drafts were proposed. The German Left, under the leadership of Plener, drafted an address which, in its timid moderation, reflected the despondency prevailing in German Liberal circles. It contained not a word that could possibly be construed into a provocation to the Czechs; and a gentle reminder that "the importance of the German element cannot be permanently ignored without detriment to the Empire," was the only manifestation of the Liberal protest against the odious Taaffe régime. The Young Czechs in their draft, on the other hand, were outspoken and defiant. They insisted on the restoration of their language to the rank to which they consider it entitled, characterized everything the Government had hitherto done in this respect as insufficient, and more than hinted that only constitutional changes in the direction of Bohemian state-right would satisfy their demands. Herr Bilinski, as the spokesman of the Poles and Conservatives, and hence of the Government, produced what the *Neue Freie Presse* justly called a "masterpiece of ambiguity," an address which might be construed equally as a demand for provincial autonomy and an assertion of the most rigid centralism. As a matter of fact, the members of the Committee charged with the drafting of the address could not reconcile their differences, and the House saw itself confronted with a deadlock from which there seemed to be no escape.

A glance at the composition of the House of Deputies will serve to bring out the nature of the differences which divide the parties. Of its 353 members, the United German Left count 108, the Conservatives or members of the Hohenwart Club 70, the Poles 55, the Young Czechs 35, the German Nationalists 20, the Christian Socialists (more properly anti-Semites) 18, the Italians, or members of the Coronini Club, 13, the Moravian Czechs 10, the Ruthenians 7, and various unclassified fractions 17. The Conservatives, Poles, Ruthenians, and perhaps the Italians could be counted upon to support Count Taaffe, but even a bare majority could only be secured by enlisting, among others, the support of the anti-Semites, and so far Count Taaffe was hardly prepared to go. In this dilemma, Dr. Smolka, the President of the House, came to the aid of the Government with an expedient which is without a parallel in the thirty years of Austria's parliamentary life. Leaving his chair, he introduced from his seat a motion to substitute for the usual address to the throne a simple expression of thanks to the Emperor for his gracious speech. This proposal secured the immediate support of all the important factions; the Young Czechs alone reserving to themselves the right of airing their grievances on some future occasion. Public opinion in Austria is, however, by no means enthusiastic over what is considered a voluntary abdication of parliamentary power, and Liberal papers like the *Neue Freie Presse* as well as Clerical papers like the *Vaterland* and Czech organs like the *Politik*, deprecate the "harmony" which the Emperor, in receiving the deputation of the Reichsrath, pretended to discover in its action. The Young Czechs, moreover, are now being taunted by the conservative Old Czechs with their submissiveness to the Government after all their fiery talk. The Liberal Germans once more hope to profit by the new demonstration of the inability of Taaffe to govern without them; while the Hohenwart Club shows serious symptoms of resolving itself into the elements which gave it its precarious life—the Bohemian Feudalists, South Slavs, and the Clericals of all sorts and nationalties. And Taaffe has at least the satisfaction of having persevered in the impossible task of "reconciling" Austrian parliamentary parties longer than any other Premier before him.

POLITICAL BANKING.

THE Keystone Bank of Philadelphia, about whose condition damaging reports had been in circulation for several months, was closed on the 20th of March last, by order of the Comptroller of the Currency. It was said by its President that "an earnest effort to fully restore the bank will be made immediately," and one of its directors said it would certainly resume in a short time, and that depositors would "not lose a single penny of their deposits." The National Bank Examiner, N. P. Drew, declared at the same time that he believed the bank to be in good condition for recovery. Very different views were to be heard, however, in banking circles, for it was generally believed there that the condition of the bank was far from sound. Days and weeks were allowed to pass without the appointment of a receiver. On May 8, seven weeks after the closing of the bank's doors, two other Philadelphia banks failed, and it was rumored that their failure had been brought about by the Keystone collapse, or by causes similar to those which had undermined that institution. On May 9 the Comptroller of the Currency appointed a receiver for the Keystone Bank, and a committee of the City Council began soon afterwards an investigation into the city deposits in the three collapsed banks.

There had been ugly rumors abroad before the appointment of the receiver, to the effect that the unusual delay in the appointment was due to high political influence at Washington. On May 15, the Philadelphia *Inquirer*, which is a very loyal Republican paper, printed a double-leaded article, asking many direct questions in regard to the bank and its affairs and their relations to politics, and closing with the following, which was printed in italics: "Was there any official of the Government, higher in authority than Bank Examiner Drew, who shielded the rottenness from the public and used his influence to prevent the receivership?" That there was "rottenness" in the bank there was at this time no longer any doubt. The President had been placed under arrest, together with the Cashier, and there were unmistakable evidences that there had been plundering on a very large scale. On May 22 the President forfeited his bail and fled, and on the same date John Bardsley, the City Treasurer of Philadelphia, resigned his office and made public confession that $930,000 of the State's money and $400,000 of the city's money had been deposited by him in the Keystone Bank, and lost.

It has been shown by the investigation that the bank has been bankrupt since August, 1888, and that Mr. Bardsley was aware of its condition when he took office in January, 1889. Knowing it to be bankrupt, he continued in it a city deposit of $400,000, and between January, 1889, and October, 1890, put into it no less than $930,000 of State money. It has been shown, also, that a former president of the bank, now dead, embezzled $998,000 of its funds and used it in real-estate speculations, and that the bank concealed his dishonesty, which was not discovered till after his death, and attempted to carry the loss and conceal it in the bank's accounts by false entries. About $400,000 was refunded from the estate of the dead President, but the remaining $598,000 has never been made good. In the period during which Mr. Bardsley was pouring the State's money into the bank there was a quiet withdrawal of deposits effected by heavy depositors, who had evidently been given a "tip," for the soundness of the bank had not been questioned. No less than $329,000 was drawn out in this manner just previous to October, 1890. There was then left in the bank $1,100,000 in deposits, including $930,000 of State money. In November whispers began to be heard of the bank's unstable condition, and in December a "run" was made upon it, during which nearly all its deposits were withdrawn, except the city and State deposits, which Mr. Bardsley allowed to remain.

It has been shown, also, that when the National Bank Examiner made his examination of the bank, he was deceived by false statements, and that leaves had been removed from the books in order to conceal the bank's true condition. The Examiner admits that the fugitive President, Marsh, confessed to him on January 5 of this year that he had falsified the books, and that he, Mr. Drew, reported the confession to the Comptroller of the Currency at Washington. Yet the President was not arrested, and the bank was allowed to go on doing business for nearly three months. "Who can tell," asks the Philadelphia *Ledger*, "why the hand of the Federal criminal law was not laid upon Marsh and his co-conspirators two, three, or five months ago? There was enough known long ago not only to warrant that, but to demand it." Speaking upon the same point, the Philadelphia *Inquirer* says: "Then there really was some influence in Washington at work in behalf of the plundered bank. That influence was responsible for keeping the bank open for two months and taking in some additional thousands from deluded customers. This is on a par with the whole sickening business. *But what was the influence?*"

These are questions which we shall not attempt to answer, but there are some political facts about the scandal which may serve to throw light upon them. All the persons concerned in the scandal, and all those concerned in hiding it and shielding its criminals from speedy justice, belong to the Republican party. The former President of the bank, who embezzled nearly a million of its funds, was a devoted companion of John Wanamaker in all good works, political and pious, and so beloved of Wanamaker that when he died, the latter shed tears copiously over his grave. When, after his death, it was discovered that he had been a thief, the man who had been cashier under him was chosen to the bank's presidency, and this man, who was also a friend of Wanamaker, is the fugitive President, Marsh, who confessed before flight that he had falsified the bank's statements in order to conceal the former President's theft. One of the bondsmen of this fugitive President, who will have to help pay the forfeited $25,000 of bail, is a brother of John Wanamaker. Bardsley, the City Treasurer, who put $400,000 of the city's money and $930,000 of the State's money into the Keystone Bank, and $200,000 more of the city's money into another of the collapsed banks, was for many years previous to his election as City Treasurer a trusted Republican of the Wanamaker school. He was heavily in debt at the time he ran for City Treasurer in 1888, and it is said that good Mr. Wanamaker raised a purse of $75,000 to pay off these debts, but discovered after the election that he had only raised about half enough. The financial troubles of the Keystone Bank date from August, 1888, which was about the time when Mr. Wanamaker began his efforts to raise his $400,000 fund for the national Republican campaign. He was then, it is said, a director of the Keystone Bank, as well as the political and pious friend of its dead President and its living but now fugitive one.

Furthermore, the National Examiner, who admits that he knew of the thieving of the dead President, and the falsifying conduct of the living President as early as January last, has been a close personal and political friend of John Wanamaker for many years. He has testified that Wanamaker was granted discounts on large sums by the Keystone Bank beyond the 10 per cent. allowed by law, and a director of the bank admits that Marsh, the fugitive President, lent John Wanamaker $200,000 of the bank's money on his personal note last summer, without the knowledge of the directors. Finally, it will be remembered that at the time when the withdrawal of the bank's deposits began last fall, and when Bardsley began to pour the State's money in to enable the bank to pay its depositors, John Wanamaker was reported in the newspapers, whether truthfully or falsely we do not know, to be in serious financial straits.

All these curious facts may throw some light upon the conduct of the Republican party in Philadelphia and in Pennsylvania in seeking to prevent the appointment by the Governor of an honest man in place of the dishonest City Treasurer, and also upon the conduct of that party in seeking last fall to have an embezzler, Delamater, elected Governor of the State.

What has Bardsley done that Quay did not do? He used the public money, as Quay did, for private speculation, and he lost it, as Quay did, but he had no rich friends, as Quay had, to make up the loss. The Bank Examiner says that Marsh was allowed to remain at the head of the bank, after he was a confessed swindler, in the hope that his friends might recover the money that had been lost, and that the Comptroller delayed the appointment of a receiver because "he was willing to give a chance to the reputable men who were trying to get the bank on its feet." The relations of the good Mr. Wanamaker to the bank and its officials may have been in accordance with general bank

usages, but it is unfortunate that the delays in exposing the rascality of those officials and their political accomplices should be charged to powerful official influence at Washington at a time when Mr. Wanamaker is an official of that kind himself.

THE FARM CHANGE IN POLITICS.

More than a year ago, after the symptoms of farm discontent at the West had been followed by the Democratic successes at the autumn elections of 1889, we referred many times, and with all the force that we could put in words, to the changes which would be likely to ensue in the next autumn of 1890. We even named twelve States where the farm revolt would most probably break out, of which eight were at the West. The eight, it is true, did not include Kansas, now foremost in the "farm movement," and they did include California, where, for local reasons, last autumn the Republicans more than held their party strength. But out of the twelve States, in those at the West which held elections last year, and which included practically all of the old "Granger" States, the revolt went far beyond what we or anybody anticipated. And now the same movement is apparently going still further, and taking a national aspect, and may have, before it ends, national effects. This "national" character is what, for the time at least, differentiates the movement from the Granger movement of seventeen years ago, and in that phase it has certain meanings which as yet are far from being realized in all their fulness and import.

The first Granger movement may be said to have begun early in 1873, and reached its climax about a year later. It gave the politicians a good deal of alarm and swelled quickly to considerable size. In some respects it resembled the present agitation. It had to a degree the same "cheap money" flavor now revealed in the demand for free silver, and was even more "anti-railroad" in character—so much so that the loud-voiced orators of it used to describe figuratively the Western prairies as set on fire politically by the locomotive's spark. But what, as stated, separated it widely from the present agitation was its almost exclusive appeal to the State rather than to the Federal authority. The "Potter law" in Wisconsin and kindred Granger measures in other States, all aiming at "relief for the farm" by State legislation, were the most striking episodes of the time. To the Western farmer then, as well as during years later and up to a very recent period, his State was the *fons et origo* of lawmaking, to which his political vision turned rather than to the vague and distant Federal capital. He knew, or knew of, his local State Representative; he did not know much of Congressmen, or of Federal Senators, or of the indefinite, mystic, and far remote Washington. The movement, after going to some rather silly extremes, waned as quickly as it had waxed, and as early as the first months of 1875 the Potter law had been modified, and the Minnesota Grangers had been forced to content themselves with broad and general railroad restrictions which left large discretionary authority to a railroad commissioner. Out of that whole epoch of agitation about the only Federal effect was the Supreme Court Granger decisions, and those came some years later. As to the promoters and actors in the movement, they fell back easily into the old parties, so that its influence could not in the least be descried at the West in the returns of the Presidential election of 1876.

Comparing that agitation with the present movement at the West, along with its various "alliances," "leagues," "patrons," and the rest, we see the contrast instantly. The regulation of railroads, of legal rates of interest—like the absurd Minnesota "loan" law—and other visionary attempts to legislate the farmer into happiness, undoubtedly still mark the farm outbreak. But over and beyond these it is reaching out strongly into the Federal field. Hardly a convention of the farm organizations can be named but has passed its resolutions on Federal questions, notably the tariff, currency, and banks, and put in its long string of demands for Federal boons. In addition to the recent weak and unrepresentative side-show at Cincinnati, there will probably be more serious gatherings of a national character, with possibly their candidates for President and Vice-President next year; and the embattled farmers have elected Federal Senators and Representatives and at other points opposed one of the old parties fiercely. These national characteristics are undoubtedly due in part to the larger size of the revolt, as compared with that of seventeen years ago, which was also much more narrowly localized. In half a generation of time, moreover, such old party emotions as the war feeling have decreased in force and proportionally taken away from the obstacles to a national "farm" party. But whatever the causes or their relative part, the central fact is that where the voters of the Western farms have hitherto been circumscribed by State lines in their more or less temporary outbreaks, they are now overreaching them and have rushed headlong into the to them new arena of Federal polity.

And their first venture into the strange field is attended with the absurdities which were to be looked for. They grope about like lost travellers in a thick forest, give us laughable expositions of political economy, satirize history as to money questions, and make their platforms the oddest jumble of good and bad "issues." They "garble principle with nonsense," and, in the impression made on the intelligence of the country, excite momentarily and in about equal parts jeering and alarm. But, after all, was anything very different to be expected from a class of voters isolated from contact with affairs, not given to reading, and who for a quarter of a century have been more stirred by sentimental memories of the war than by the crushing material burdens of a war tariff? When such a class first exploit a new domain of politics, we expect blunders and absurdities.

The movement must be judged not by its initial vagaries, but by its secondary results after reason has followed rashness, after its demagogues have been weeded out and the truths that survive have been fertilized by the errors that fail. Those results, indeed, will probably soon be attended with the dissolution of the movement itself, and show themselves in that readjustment of the Western farm vote which the Republicans have so much cause to dread. Remembering, then, how lethargic and how partisan the Western farmers have been, how many they are as voters, and how powerful is that "common sense of most" which, in a country like ours, always throttles demagogism sooner or later, can we not look to the farmer in his condition of too radical revolt with more hope than we have looked to him in a condition of political stagnancy? Those who tremble long over such a movement in an industrial group that numbers half the voters of the country, must either be distrustful of our whole American system of self-government, or be, like the Republican protectionists, a class whose reverse is the nation's profit.

TRIALS FOR HERESY.

There is in modern society no more curious mediæval survival than trial for heresy before an ecclesiastical tribunal. When such trials first began, they were based on two assumptions: one was that the tribunal could condemn the culprit to torment in the next life; the other—somewhat inconsistent with the first—was that heresy was a contagious disease, which could be prevented from spreading, or "stamped out," if taken in time, like pleuro-pneumonia among cattle, by killing the persons infected with it. Behind these assumptions, too, there was the not unnatural feeling, in the days when authority reigned in Church and State, that when heretics, or persons inclined to heresy, found that great personages, like bishops and canonists, disapproved of their opinions, they would discard them. This last was the real origin of the practice which prevailed, even in England, down to the middle of the eighteenth century, of having obnoxious books "burnt by the common hangman" in some public place. The employment of the "common hangman" was intended to emphasize the horror felt in high places for the author's views. In truth, all trials for expression of opinion both in the Middle Ages and in more recent times were the natural and proper outcome of the general belief that there was such a thing as a divinely appointed earthly authority in matters of opinion; that the persons composing an ecclesiastical tribunal did, *ex officio*, know more than the defendant could possibly know touching the matter in hand, and that their judgments were registered and confirmed in the unseen world by a final spiritual court of appeal.

In those days, trials for heresy in which the judges and defendants were simply rival literary critics, whose opportunities of becoming acquainted with the divine will were about equally good, and in which the Court claimed no jurisdiction which it did not derive from what we may call popular

election could have got no respect whatever—in fact, would have been considered a punishable and irreverent absurdity. A court of any kind, civil or ecclesiastical, must have force of some kind behind it in order to secure respect and obedience. A spiritual court must have the power of inflicting spiritual penalties to take effect on the offender's soul after death. A temporal court must have the power of inflicting penalties on the offender's body. In other words, courts of all kinds must have authority suited to their jurisdiction, and machinery for enforcing it; otherwise they rapidly become a mockery.

If all this be true, it is an easy inference from it that Protestant trials for heresy are, and have been ever since the Reformation, a rank absurdity. All Protestant sects—the Episcopal Church would perhaps claim to be an exception—are simply conflicting Biblical critics. They have all arisen out of the differences of interpreters touching the language of one book. A Protestant ecclesiastical tribunal, therefore, unless when, as in England, it sits to apply acts of Parliament to church ritual (and here it really is trying the title to property), if it undertakes to try a minister for heresy, is simply arranging for a debate between two bodies of opposing commentators, with almost a certainty that the defendant at the bar will be the abler of the two parties. When heresy means not defiance of generally accepted divine authority, but simply a hermeneutical difference from other brethren of the same standing in the Church, the chances are 100 to 1 that the heretic will be by far better equipped and more competent than his judges. It is, as a rule, owing to his hermeneutical capacity and devotion that he has become conspicuous, and the reason for trying him is that his conclusions on questions of interpretation have begun to weigh more with those who attach importance to such matters, and are capable of understanding them, than those of his opponents. To take Dr. Briggs's case as an example, the probabilities are that his word touching the true meaning and origin of any chapter or verse of the Bible would go twice as far with the more intelligent readers of the Bible as that of any man who will sit on the bench to judge him. Moreover, the man who sits on the bench to judge him will not be able to close his mouth with any assumption of authority whatever, owing to the fact that all Biblical questions are questions of translation from dead languages. Nobody but a learned Greek or a Jew of the first three centuries is, in fact, competent to sit on the Briggs case as *an authority*. All others must sit as disputants, with a strong chance of getting the worst of the dispute.

Another absurdity about modern heresy trials is that although their avowed object is to prevent mischief to the Church, no pretence is made that the condemnation of the heretic will prevent the spread of his opinions. A mediæval heretic could be silenced by death, and the mere fact that a spiritual tribunal thought him worthy of death no doubt closed the ears of a vast body of pious people to his teachings as probably suggestions of Satan. But Dr. Briggs's condemnation by the Presbyterian courts will not prevent a single human being from listening to his interpretations, while it will certainly greatly help to spread them, by drawing public attention to them and exciting public interest in them.

Moreover, while a mediæval ecclesiastical tribunal had some excuse, in the then intellectual condition of the world, for considering the heretic an isolated man, or sort of religious monstrosity, whose guilt was shared by few or none with whom he had not come into personal contact, a modern ecclesiastical tribunal, which in this age of discussion relies on extirpating or repressing heresy by the punishment of one offender, makes, *ipso facto*, a confession of its incompetency. All modern heretics are simply the bolder members of a large body of thinkers. If we had time or space to go in detail into the ecclesiastical history of the last half century, we should be able to supply abundant illustrations of the fact that every ecclesiastical as well as scientific come-outer is simply the exponent of views which have, secretly or openly, partially or wholly, vaguely or clearly, taken hold of a considerable number of other minds. The usual effect on these minds of judicial proceedings against the offender is either to glorify him as a martyr or else to illumine and clarify his teachings through the discussions raised by the trial. There is, in fact, no more dangerous thing for a modern religious denomination which cares for fixity of creed than forcing a dissenter into the judicial forum to give reasons for his heterodoxy. We do not believe there has been a single attempt of the kind which has not ended badly for the creed. *Quieta non movere* should be written over the door of every modern church.

BALMACEDA'S DEFENCE.

President Balmaceda has, in the message which he has addressed to his Congress, made confessions of the most extraordinary character. The document is one which in fact would have served perfectly well as a manifesto of Louis Napoleon after the *Coup d'État* of 1851, or a proclamation of Boulanger if he had succeeded in getting possession of the Government and dispersing the Chambers, or of Andrew Johnson in 1867, if he had come to blows with Congress. He talks throughout as a saviour of society, who derives his power from some source superior to that from which the Congress derives its power. We need hardly say that both draw their authority from the same fountain, and are, under the Chilian Constitution, equal and independent, each in its own sphere, except that Congress has the right to impeach the President, and appoint a commission to watch him during the legislative recess, and keep him in the country, *nolens volens*, a year after the expiration of his term of office, to see if any ground of impeachment appear.

The only part of the message which has any relevancy is Balmaceda s explanation of the causes of the quarrel between himself and Congress. They are almost exactly Boulanger's reasons for desiring the French people to make him a dictator and abolish the parliamentary system. The following criticism on the Chamber reads like an extract from Boulanger's manifestoes:

> "The Liberal party has been wanting in that unity of idea, of direction, and of method without which it could not of itself suffice for the government of Chili. It is because of this want of unity that it has often been compelled to demand help from the Conservatives or other political groups, in spite of its differences with them. . . .
>
> "The spirit of absorption, and the essentially personal tendencies of the different groups, the excessive number of the Senators and Deputies, . . . have produced disunion in the Liberal party and the disorganization of the traditional historical parties. Hence there has arisen in Parliament a deplorable anarchy and political uncertainty, resulting in diversity and inconsistency of personal groups, whose unmeasured ambition have made parliamentary labors sterile and led fatally to a general perturbation."

Balmaceda evidently thinks parliaments not only useless but mischievous. His wail, in truth, not only resembles Boulanger's, but the earlier exposures of the "régime parlementaire" which poor old Persigny used to make between 1851 and 1860 in behalf of his master.

President Balmaceda then goes on to show that when he organized the Cabinet of M. Lillo, he expected the majority in the Chamber to support it; but the majority failed to do so, as has happened so often in France of late years. After this he tried other Cabinets, but all failed to secure the support of a majority in Congress. At last, in 1889, he formed a Liberal Cabinet, which had a majority and might have worked well but for a dispute about the manner in which the convention which was to nominate Balmaceda's successor to the Presidency was to be constituted; Congress apparently being desirous of breaking up the old practice of allowing each President "to name his successor," as we say. Then there were quarrels about the Presidential power of collecting the taxes, and about the execution of the electoral laws, and various other matters. Congress clearly, according to his own story, had lost confidence in him, and were determined to tie his hands in every lawful way, like our Congress in 1867. He got rid of his enemies at last by the close of the session, which he refused to prolong, as the Constitution allowed. But the ad-interim Commission which sits in the recess was just as hostile to him, he says, as the Congress had been, and called on the whole Congress to sit with it to watch him. No appropriations had been made for the army and navy. What was he to do? The naïveté of the following answer to this question is remarkable:

> "Being charged under the Constitution with the duty of administering the State and of extending my authority over everything necessary for the internal security of the nation, *I was then obliged to assume all the public powers* in order to repress armed rebellion and meet the position taken by Congress which was tending to the overthrow of our institutions and of established order. I was obliged to bring together the elements necessary to defend and make triumphant those principles of authority in Chili without which nothing solid or durable can exist in the future. *These circumstances imposed on us the painful duty of reducing the chiefs and promoters of the revolt to impotence by arresting them or driving them away from the scene of their activity.*"

He adds that for similar reasons he closed the higher courts of law. It will be seen that he here describes and justifies a *coup d'état* in almost the exact language of a Napoleonic Cæsar, engaged in saving society from the "rhéteurs" and "avocats." When Congress fails to make appropriations for the army and navy, he does not call it together and urge it to do its duty, or disband the army and navy and let the country see the consequences of its misconduct, or borrow money to keep the service going and take the chances of an indemnity bill. He simply arrests and disperses the Legislature, closes the courts, and proceeds to govern by martial law. Moreover, this is not the charge of an enemy; it is his own account of his doings.

Oddly enough, too, in spite of these admissions, which ought to fix his position beyond peradventure in the eyes of all constitutional countries, the little accident that he has a Minister in Washington, and that one of the Congressional ships violated our neutrality laws, has carried a large portion of the American press over to his side as the legitimate ruler of Chili. On his own showing, he is really an impeachable traitor and usurper, whose trial ought to be the first business of any regularly elected Congress; and one may say this without by any means approving the course of his opponents.

How near Andrew Johnson came to Balmaceda's position, the following extract from his message of December 2, 1867, shows:

"If Congress should pass an act which is not only in palpable conflict with the Constitution, but will certainly, if carried out, produce immediate and irreparable injury to the organic structure of the Government, and if there be neither judicial remedy for the wrongs it inflicts, nor power in the people to protect themselves without the official aid of their elected defender—if, for instance, the legislative department should pass an act, even through all the forms of law, to abolish a coördinate department of the Government—in such a case the President must take the high responsibilities of his office, and save the life of the nation at all hazards."

THOMAS PAINE AND GOUVERNEUR MORRIS IN PARIS.

NEW YORK, May 30, 1891.

FOR nearly a hundred years some mystery has surrounded the ten months' imprisonment of Paine during the French Revolution, and in this dusk one or another figure has been inferentially discovered at work, according to the prepossessions of those who have considered the matter. He is supposed to have been followed by the enmity of the "Mountain" (party of Marat, Robespierre, and Danton), after his speech against the execution of the King. But proofs of Danton's subsequent friendship for Paine have been discovered recently. Danton warned Paine to stay away from the Convention on June 2, 1793, when the Girondist leaders were to be arrested, and he could hardly have kept Paine's name out of the list without the connivance of Marat. With his own hand Marat erased from the same list M. Lanthenas, translator of Paine's works. Furthermore, Marat was slain by Charlotte Corday more than six months before Paine's imprisonment. Robespierre then became chief of the Mountain. If he had been disposed to harm Paine, why should he have waited six months? During the summer of 1793 Paine lived among his friends peacefully, absenting himself, indeed, from the Convention, because he would not unite in their terrible decrees, but giving no offence, and working on the Constitution. When this Constitution, to help frame which he had been invited to France, was offered, Robespierre had eulogized it, and no word ever fell from his lips against Paine. But after Robespierre's death, July 27, 1794, the Committee that examined his papers found a note in his handwriting: "Demander que Thomas Payne soit décreté d'accusation pour les intérêts de l'Amérique autant que de la France."

This, equivalent to a death-sentence, puzzled the Committee, who added in their report: "Why Thomas Payne more than another? Because he contributed to the liberty of both worlds." Paine also was mystified by the form of the sentence. "There must," he says, "have been a coalition in sentiment, if not in fact, between the terrorists of America and the terrorists of France, and Robespierre must have known it, or he could not have had the idea of putting America into the bill of accusation against me." Before me, however, are documents, obtained from the French and American Archives and from private hands, which cast light on the subject and tell a strange story.

In the beginning of the French Revolution the United States had in Paris typical representatives of the contrarious principles then contending in this country. The conflict of Jefferson and Hamilton in the Cabinet had its counterpart in that of Paine and Gouverneur Morris in France. Morris had come to Europe (1789) with a commission from Washington, the secret nature of which rendered him a very important personage. Jefferson, then Minister in France, received no sympathy from Morris in his "expectations of a downright republican government." Morris actively favored the Royalists, and wrote the manifesto of Louis XVI. published by Sparks. Paine, on the other hand, wrote the first Republican manifesto, which was found nailed on the door of the Legislature. In the year 1792 Morris received his appointment as Minister to France, and Paine was elected to the Convention—by four departments, from which he selected Calais. Paine frankly told Morris that he considered his appointment "unfortunate," and Morris was equally frank in repudiating Paine's doctrines; but their personal relations were friendly. The Diary of Morris shows him dining Paine and obtaining important information from him. In January, 1793, the royalism of Morris and the humanity of Paine brought them into a common anxiety to save the King's life. But in the spring of that year a break occurred between them.

After the King's execution (January 21, 1793), immediately followed by war with England, Morris believed it would be an advantage for the United States to be rid of its treaty obligations with France. He so wrote repeatedly to the Secretary of State. An opportunity presently occurred for acting on this idea. In reprisal for the seizure by British cruisers of American ships conveying provisions to France, the French cruisers were ordered to do the same, and a large number of our vessels were carried into Bordeaux. Here they were not allowed to reload with French goods, and go to sea, where they would be liable to capture and their cargoes benefit England. Morris pointed out to the French Government this violation of the treaty, and wrote to Jefferson that he would leave it to them in Philadelphia to insist on the treaty's observance, or to accept the "unfettered" condition in which its violation by France left them. Consultation with Philadelphia was a slow business, however, and the troubles of the ninety-two American vessels laid up at Bordeaux were urgent. The captains seem to have applied to Morris through Paine, but the Minister showed apathy, and in one interview Paine asked him "if he did not feel ashamed to take the money of the country and do nothing for it." It was, of course, a part of Morris's case against the treaty's continuance to point out its violation and the hardships resulting therefrom; but the American seamen needed practical relief, and it was the reverse of any part of his case to obtain this. The captains sent a deputation to him (August 20, 1793), and, being angrily repulsed, thenceforth had no more to do with him. They consulted Paine, and on August 22 offered a petition to the Convention itself, in which they said: "We, who know your political situation, do not come to you to demand of you the rigorous execution of the treaties of alliance which unite us to you. We confine ourselves to ask, for the present, to carry provisions to your colonies." A suspension of the treaty thus excused by the only sufferers could no more be cited as releasing the United States. Apart from this "mischief," as he described it, Morris was humiliated by this direct application and the response to it. In his report (October 10) to Jefferson he belittled the success, and said it had "only served an ambition so contemptible that I shall draw over it the veil of oblivion."

The "ambition" veiled from Jefferson was revealed to others. "I suspected," Morris had some weeks before written to Robert Morris, "that Paine was intriguing against me, although he put on a face of attachment. Since that period I am confirmed in the idea, for he came to my house with Col. Oswald, and, being a little more drunk than usual, behaved extremely ill, and through his insolence I discovered clearly his vain ambition." This was probably written soon after Paine's rebuke already quoted. There is some ground for believing that for a week or two after the arrest of his friends, the Girondists, June 2, Paine's mental anguish drove him to excess; but it is doubtful whether Col. Oswald would have taken a tipsy man twenty-seven miles out of Paris to Morris's retreat, or the tipsy man remembered the words of his rebuke two years later, when Paine records them in a letter to Washington. At any rate, if Morris saw no deeper into Paine's physical than into his mental condition, the "insolent" words were those of soberness. For Paine's private letters show him ignorant of any intrigue against Morris, and under an impression that he had asked for recall; also, that, instead of being ambitious to succeed Morris, he longed only to get out of France and into America as soon as possible. The demand for Morris's recall was due to his refusal to accommodate the Ministers in 1792 in a money matter, also to his intercepted letters showing preferences for England, and was conveyed through De Ternant, whom Morris had been the means of sending to America. Paine's real feeling in the matter is shown in a letter (unpublished) to Barrère of the Comité de la Sûreté Générale, who consulted him. It is dated September 5, 1793:

"I send you the papers you asked for. The idea you have to send Commissioners to Congress, and of which you spoke to me yesterday, is excellent, and very necessary at this moment. Mr. Jefferson, formerly Minister of the United States in France, and actually Minister of Foreign Affairs at Congress, is an ardent defender of the interests of France.

Gouverneur Morris, who is here now, is badly disposed towards you. I believe he has expressed the wish to be recalled. The reports which he will make on his arrival will not be to the advantage of France. This event necessitates the sending direct of Commissioners from the Convention. Morris is not popular in America. He has set the Americans who are here against him, as also the Captains of that nation, who have come from Bordeaux, by his negligence with regard to the affair they had to treat about with the Convention. *Between us*, he told them: That they had thrown themselves into the lion's mouth, and it was for them to get out of it as best they could. I shall return to America on one of the vessels which will start from Bordeaux in the month of October. This was the project I had formed, should the rupture not take place between America and England; but now it is necessary for me to be there as soon as possible. The Congress will require a great deal of information independently of this. It will soon be seven years that I have been absent from America, and my affairs in that country have suffered considerably through my absence. My house and farm buildings have been entirely destroyed through an accidental fire. Morris has many relations in America, who are excellent patriots. I enclose you a letter which I received from his brother, Gen. Louis Morris, who was a member of the Congress at the time of the Declaration of Independence. You will see by it that he writes like a good patriot. I only mention this so that you may know the true state of things. It will be fit to have respect for G. Morris, on account of his relations, who, as I said above, are excellent patriots."

About the same time that Committeeman Barrère was consulting Paine about sending Commissioners to America, the Minister of Foreign Affairs, M. Deforgues, was consulting Morris. When France had demanded the recall of Morris, Edmund Randolph, Attorney General, had persuaded Washington to wait until he could be heard. This delay was a surprise to Morris, who says that the French Ministry then took it into their heads that he was "immovable," and began "overtures for conciliation." He was thus all-powerful when he had the consultation with M. Deforgues. Morris had discovered that this Minister was himself anxious to get out of France and take Genêt's place in America. All of these circumstances had given Morris, for the interview, the strength of a giant, and he used it like a giant. Unfortunately for Paine, he was just then, *malgré lui*, the actual Minister of the captains and other Americans in Paris, and Morris believed that he was aiming to become the official Minister. He was therefore delivered over to the tender mercies of Robespierre. The French Ministry having not only recalled Genêt, but demanded him for punishment because of the offence he had given Washington, Morris remembered that Paine had introduced Genêt to him in Paris, as no doubt to influential persons in America. In reporting his interview with Deforgues to Washington (Oct. 18, 1793), Morris says: "I told the Minister that I had observed an overruling influence in their affairs which seemed to come from the other side of the Channel, and at the same time had traced the intention to excite a seditious spirit in America; that it was impossible to be on a friendly footing with such persons, but that at present a different spirit seemed to prevail, etc. This declaration produced the effect I intended."

This effect was that Paine was ominously mentioned in Amar's report of October, which preceded the guillotining of the Girondists. This was followed by the denunciation of Paine on Christmas Day, by Bourdon de l'Oise. "They have boasted the patriotism of Thomas Paine. *Eh, bien!* Since the Brissotins disappeared from the bosom of the Convention he has not set foot in it; and I know that he has intrigued with a former agent of the Office of Foreign Affairs."

It was sufficiently ingenious for Morris to allude to Paine being an influence from the other side of the Channel; it disclaimed jurisdiction over Paine, and suggested that he was an Englishman worrying Washington through Genêt—this being the only agent of Foreign Affairs with whom Paine could have been connected by Bourdon de l'Oise. This was also plausible, for Paine sympathized warmly with the project of the Kentuckians to expel the Spanish from the Mississippi. Bourdon de l'Oise was followed by Bentabolle, who moved the exclusion of foreigners "from every public function during the war." Three days later Paine was imprisoned in the Luxembourg, December 28, 1793.

MONCURE D. CONWAY.

THE VENETIAN ARCHIVES.

VENICE, May, 1891.

THE student of English history has not been unmindful of the wealth of material illustrating the foreign, and indeed the domestic, policy of England which are preserved in the Venetian archives. The holiday visitor to Venice spends his admiration on the Church of the Frari, with the tombs of Titian, Canova, and the various Venetian worthies; but a few strokes of the gondolier brings him where the student of history is more content. It is the monastic buildings of the same Frari, round two large courts, which are now devoted to the storing of the voluminous documentary records of Venice. As you pass along the cloisters towards the staircase which leads to the offices, you notice on the walls a tablet to the memory of Rawdon Brown, who spent many years in searching these Archives for the materials of English history, and so ingratiated himself with the Italian scholars among whom he lived that the story of his service is thus carved on stone near the scene of his labors and in the language of the people whom he passionately loved. Those who have had to search for the evidences of the earliest explorations on the American coasts have not passed by the crowded volumes of the Venetian calendars which Mr. Brown communicated to the series of publications issued under the superintendence of the Master of the Rolls. Brown, when he died some eight years ago, left the last of his volumes incomplete; but an associate finished it for publication. Last September the authorities of the English Public Record Office appointed as his successor Mr. Horatio Forbes Brown, a long-time resident of Venice, an Oxfordian, and a Scotchman, and a namesake of his predecessor, but of no kinship—a gentleman whose studies in Venetian history and in the early typographical records of Venice have made his name known to the lovers of Venetian lore. I have had some talks with this gentleman on his work in the archives, and he is at present making transcripts and abstracts of the despatches and relations of the Venetian Ambassadors at Madrid and Paris, respecting the preparations and prospects of the Spanish Armada. He tells me that the Venetian envoys conveyed to their home Government at the time a strong sense of the hopelessness of the task which Spain had undertaken.

The publication with which Mr. Alexander Brown of Virginia has recently enriched the documentary history of America, shows how the archives of Simancas have yielded important material for the history of the early settlements on the coast of New England, through the information which the Spanish agents in London obtained from the returned English navigators—obtained, doubtless, in some instances, by suborning, while it was sometimes information made to sell. Mr. Brown tells me it is the same with the Venetian envoys in Madrid and the Low Countries, and that they not infrequently cautioned the home Government as to the dependence to be placed on the information which they conveyed.

The records here in the main go back to the thirteenth century, though some have escaped the early conflagrations and carry the imagination even to the ninth century. The reports of the ambassadors of the fifteenth, sixteenth, and seventeenth centuries, which are most interesting to the foreign student, are contained in two or three of the very extensive ranges of rooms which hold the entire collection. The documents are certainly in good order, and the keeper told me the rooms are cleaned twice a year. Some of the records are bound, but the great mass of illustrative papers are simply laid within pasteboard covers, labelled on the back, and filling shelf above shelf in the lofty apartments. The Austrian Government is largely credited with the care which has brought the papers together from numerous depositories. Since the amalgamation of Venice with Italy, the growth has been largely from the current notarial records of the town and the administrative records of the departments. The records of the notaries have always been an important part of the archives in Italy. Formerly there was a considerable annual expenditure in repairing the older and more dilapidated records, but the policy seems rather now to copy than to attempt to restore those which have become considerably wasted.

There is not so much among these records of the fifteenth and sixteenth centuries relating to Western explorations as one could wish, or might even expect. I believe there is no reference to Columbus to be found in them, and that the mention of one Colombo, a pirate, which Rawdon Brown was deceived into accounting the same person as the famous Genoese, was only one of a family of sea-rovers which has been often confounded with the stock of the wool-comber's son.

The material which the foreign student mainly depends upon are the despatches of the ambassadors of Venice, and the summaries of their experience which they gave the Senate on returning from their missions. These last, from 1492 to 1699, have been printed, but they are not greatly useful to the student of American exploration and colonization, as the interests of Venice extended eastward rather than westward, and England plays, in both the despatches and summaries, a far less important part than the Continental countries. It is unfortunate that, for the reign of Elizabeth, when English sea-adventure was at its height, the Protestant proclivities of England deprived her almost wholly of relations with Venice, and there are no glimpses of English deeds and policy except as they were discerned from the Continental courts. It was not till 1603 that the regular series of English reports began.

The progress which the present agent of the Master of the Rolls can make does not indicate that his task of digesting the reports regarding English doings, ending with the fall of the Venetian republic under Napoleon, is to be consummated very early. Some five and twenty years ago, Berchet anticipated the interest in the Cromwellian period by his 'Cromwell e la Repubblica di Venezia,' but the book, though interesting—and Carlyle

lacked the advantage of using it—can hardly prevent their further exposition in the Rolls series when the period of the English republic is reached.

I chanced to hit upon a letter signed by Franklin, Adams, and Jefferson, which, in 1785, was sent to the Venetian Ambassadors at Paris, and it is possible that a search might reveal other letters touching our interests in European politics.

I found, when at the Archivio to-day, six or eight students at work in the public room. A German investigator whom I met tells me that something over thirty can now be seen daily in the Vatican; but the reports which I get from users of the Vatican archives are not pleasant ones, being to the effect that one can hardly ever feel sure that the officials have exercised intelligent care in laying before the reader what he wishes to see. They have few or no registers of the contents of the Archives to help in searching, and the patient waiter for the attention of the servants of the archives has absolutely no chance of aiding their search or ascertaining the fidelity of it. Here in Venice the frequenters find little to complain of. There is, indeed, but a rough index to furnish any clue to what is desired; but the classified papers are in the main chonologically arranged, and it costs nothing more than tedious sifting of bundle after bundle to find what is searched for, and these bundles are brought promptly by the attendants.

JUSTIN WINSOR.

Correspondence.

A LOGICAL INFERENCE.

TO THE EDITOR OF THE NATION:

SIR: Your editorial of the 28th set forth how a delegation from the Cincinnati Convention called on Mr. Carlisle, and how the latter, by a few simple questions, upset all their theories and reduced them to silence. Your comment upon this serves my purpose so admirably that I ask leave to reproduce it:

"It is very difficult to reach those who are dominated by a confusion of ideas through a newspaper article or a speech. Neither of these applies any real pressure to their minds. They let the argument slip by as something perhaps a little puzzling for the moment, but to which they will find an answer presently; but when face to face with an honest questioner, who does not rouse their antagonism, they are compelled to dive at once into the recesses of their knowledge-box for an answer, or, in other words, to think the thing out."

This seems to me the most powerful of all arguments for giving to the Cabinet officers seats in Congress. The confusion of economic ideas is just as great in Congress as among the people. The presence of a high official, representing through the President the whole country, and whose duty it was to examine and expound in public debate, and in answer to the questions of individual members, the bearing of every measure brought forward upon the general interest, would do more to bring into operation the sober second thought of the nation than all the newspaper discussions and reform associations to the end of time.

So plain and simple is this proposition that if it stood upon its own merits, it would be reduced to practice in the next session of Congress. But it does not. That body is so joined to its idols that it prefers darkness to light. It is exceedingly jealous of having anybody (except its elected party Speaker) guide or control its deliberations. It is under cover of the confusion of ideas and of a fictitious public opinion, that the private and party and lobby intriguers manipulate their schemes through the Legislature. There is not in Congress a single element which wants the public represented, or the chaos of thought cleared up, or the cold, lucid brain of a statesman applied as a touchstone to their schemes for plundering the people. For that very reason these things form the most available basis for a third party appealing to the nation for support G. B.

BOSTON, May 30, 1891.

BIRTH-RATE IN FRANCE.

TO THE EDITOR OF THE NATION:

SIR: As supplementing the article in your issue of May 21, on the birth-rate and population of France and the chauvinist fears of some of the French writers, the following may interest the readers of the *Nation:*

It is only of late years that France has really taken the matter of public health into serious consideration, and since 1885 has begun a somewhat systematic registration of vital statistics, not yet in general or very successful operation. Quite recently M. Henri Monod, the Director of the Public Health Department in the Ministry of the Interior, has been able to present strong arguments in favor of a further development of sanitary laws, backed by some remarkable statistics lately become available and gathered with much painstaking and wearisome labor, showing that thousands of lives, in the period of their greatest usefulness to society and the State, are annually sacrificed by the ravages of preventable disease. England's Public Health Act dates from 1875; and citing those laws with their remarkable results for a series of fifteen years in lowering the death-rate and improving the conditions of living generally, Monod states "that were similar sanitary laws in operation in France, 130,000 lives would be saved annually." Another eminent French hygienist, Brouardel, in a paper on health matters before the French Academy of Medicine, pleaded for compulsory vaccination and revaccination, and held the State responsible for 14,000 lives annually sacrificed to smallpox, reasonably presuming upon as good results as follow from the Prussian system. In the same paper he tabulates many thousand lives lost by typhoid fever, and notes the commencing improvements in the death-rates of cities and provinces where sanitary measures are being put in operation, particularly purer water supplies.

Both these eminent authorities, strengthened in their convictions by the growing statistics dating from 1885, are bringing home to the nation the enormous losses occurring annually from the infectious eruptive fevers, typhoid, tuberculosis, diphtheria, and the diseases of debility resulting from impure and adulterated supplies of food and drink. Monod shows a list of twenty-one communes in which substantial diminution of mortality rates has already followed disuse of surface water, shallow surface pools or ponds, "surface drainage." In Bessèges, where the mortality-rate had reached 32.4 per thousand for the years 1881-'84, a reduction of no less than 13 per cent. had occurred in the years 1885 '90, and it is pointed out that this saving of life had resulted from the provision of a wholesome public-water service in 1885. Monod also states that typhoid fever, for which France retains an unenviable notoriety, has hardly been present at all since the completion of the new works. Looking upon this experience, he exclaims, "How many are the cities of France where the general mortality is excessive, and where typhoid fever is normally endemic; how much longer will it be before they understand, before their populations perceive, that if there is an expenditure which is justifiable—perhaps, indeed, obligatory—and at the same time remunerative, it is above all that which has for its certain result the preservation of human life!" C. A. SIEGFRIED.

TO THE EDITOR OF THE NATION:

SIR: I have not noticed, in the recent discussion of the causes of the low birth-rate in France, any allusion to one that was suggested in a magazine article which I read some years ago—the title of it I have forgotten—and which seems to me not without importance. It was to the effect that the French law of inheritance, requiring the equal division of the estate of the parents among their children, operated as a discouragement to large families by depriving parents of the power to make special provision for such children as might need it. Parents who might be reasonably confident of leaving a comfortable property to two or three children, could hardly hope to do as much for each one of ten or a dozen. That the French race, under favorable circumstances, is not deficient in fecundity, is sufficiently shown by the example of Canada. W. L. WORCESTER.

LITTLE ROCK, ARK., May 25, 1891.

[This undoubted *vera causa* has been fully discussed in the writings of the late M. Le Play (a reformer whose work is still carried on by organizations having *La Réforme Sociale* for their mouthpiece), and in Claudio Jannet's 'Les Résultats du Partage Forcé des Successions en Provence,' of which a second edition was published just twenty years ago. See the *Nation* of October 3, 1872, and May 6, 1875.—ED. NATION.]

THE W. F. ALLEN MEMORIAL VOLUME.

TO THE EDITOR OF THE NATION:

SIR: The loyal devotion of brother scholars to the memory of Prof. Allen of the University of Wisconsin has borne fruit in a volume, already noticed in the *Nation*, made up of selections from his scattered essays and monographs. Feeling that your notice was hardly an adequate recognition of the real importance of this work, I ask a brief space wherein to add a few words explanatory of what Prof. Allen has done. The volume deserves this not merely because it was in the *Nation* that some of the best fruits of the Professor's ripened scholarship were printed, but also because of the intrinsic merit of the essays themselves. The most important of these are in the field of primitive and mediæval institutions, and are a permanent contribution to the literature of an exceedingly perplexing subject. They are known by scholars in England and Germany, and are highly prized by the few in this country who are so fortunate as to possess the modest reprints from the Proceedings of the Wisconsin Academy of Arts and Sciences, and who, it may be said, have never failed to recognize the handiwork of a master in the reviews in the *Nation* of books bearing on the above subjects. Prof. Allen's attitude in approaching the institutions of the early period was a singularly impartial one; in his work there is no evidence of prejudice or historical bias. He was liberally conservative, always ready to appreciate the productions of every scholar and to condemn none, however much he might differ from him. This is the more important for the

reason that, among the many American scholars writing about Germanic institutions, he was one of the very few who, from a sound and independent scholarship, were competent to criticise or to express an opinion.

The latest and ripest of his contributions are "The Primitive Democracy of the Germans" and "The Village Community and Serfdom in England." In these he seeks to defend the old view of the independence of the *ceorl* as against the views advanced by Mr. Seebohm and Mr. Ross. The defence seems conclusive. Yet Professor Allen was no mere follower of the English school; he constantly shows a latent scepticism towards the views of Sir Henry Maine, and is antagonistic, though not expressly announcing it, to many of Mr. Freeman's favorite theories. He follows Bishop Stubbs in his conception of the village community in England as a constitutional unit, yet opposes him in his interpretation of the Court Baron as the original court of free settlers. This judgment has recently found a sort of indirect support in Maitland's discussion of the leet jury in his 'Select Pleas.' He is in sympathy with Earle's *gesith* theory, at least in the principle of the composite origin of the manor; nevertheless, he differs from him on such important points as the distinction between township and vill, the purely military origin of the lord of the manor, the police functions of the *gesithas*, etc. In his interpretation of Tacitus's much discussed passages, Prof. Allen became somewhat bolder. Approaching the subject from the point of view of an historical scholar as well as text editor, he brought no previously conceived opinion to bear upon such discussion as had Maurer, Ross, Baumstark, Fustel de Coulanges, Seebohm, and even Waitz. Therefore he sought for the spirit as well as the letter. He was opposed to the existence of private land-holding, as well as to the theory of the freeman living solely in *Einzelnhöfe*, as manorial lords, with slaves in the *vici*. He rather finds freemen in both, the former possibly occupied by the *principes* with their free retainers, and the latter by the common freemen, the rank and file. He denies the statement, once more asserted by Fustel de Coulanges (in "L'Alleu et la Domaine Rurale"), that the Germans were a sedentary people even at the time of the writing of the 'Germania.' We may not agree with all these statements and suggestions, but we confess that he has materially aided in the solution of the problem.

But it is not my intention to discuss the papers *in extenso;* rather do I wish to call attention more directly than has been done to the labors of so able a scholar, who has left no single great work upon a subject he was so competent to treat. For Professor Allen was an independent thinker, who knew his sources thoroughly, and who in consequence followed no school or set of historians. Therefore now that these monographs have become so accessible, it is to be hoped that they will serve a much needed purpose, in acting as an antidote and corrective to better known and more popular writing on the subject of Germanic institutions, in which well-worn and in part discarded theories are threshed *ad nauseam.*

CHARLES M. ANDREWS.

BRYN MAWR COLLEGE, May 25, 1891.

Notes.

THE Century Co. at length announce for issue in the autumn George Kennan's 'Siberia and the Exile System,' in two volumes, containing much matter that has not appeared in the *Century Magazine*; 'The Land of the Lamas,' travels in Thibet, by W. Woodville Rockhill; 'The Women of the French Salon,' by Amelia Gere Mason, printed in two colors; and Frank R. Stockton's 'The Squirrel Inn,' with illustrations by A. B. Frost.

Harper & Bros. will shortly publish 'Jinrikisha Days in Japan,' by Eliza R. Scidmore; 'Unhappy Loves of Men of Genius,' by Thomas Hitchcock; and 'A Group of Noble Dames,' by Thomas Hardy.

Houghton, Mifflin & Co. will have ready in the fall a work on 'Municipal Corporations,' by Charles F. Beach, jr.

Thomas Whittaker has nearly ready 'John Howard,' by James S. Ellis, in the series called "Men with a Mission."

'The Bravest Five Hundred of '61: Their noble deeds described by themselves. Compiled by Theodore F. Rodenbough,' lately published by G. W. Dillingham of this city, is an enlarged reissue of a book published in 1886, by G. P. Putnam's Sons, with the title 'Uncle Sam's Medal of Honor.' Seventy-two pages of new matter are inserted in the middle of the book, and a few alterations made in the appendix; otherwise the two books appear to be the same.

To the somewhat miscellaneous collection of biographies of the "Great Artists," of which Charles Scribner's Sons are the American publishers, have been added those of David Cox and Peter De Wint, by Gilbert R. Redgrave, the two in one volume. Mr. Redgrave gives a straightforward account of the uneventful lives of these very respectable painters, but hardly manages, either by his comment or by the accompanying illustrations, to demonstrate their right to a place among the "great artists" of the world. He should probably be given the full credit of adding to the English language the word "onceness."

Harper & Bros. have issued in a convenient form for the pocket the classic selection from the Poems of Wordsworth made by the late Matthew Arnold, and long familiar in the irreproachable garb of the Golden Treasury Series of Macmillan & Co. This more intimate form is welcome, and it is only necessary to remark of it that it appears to follow the text of the edition of 1879; in later issues, Mr. Arnold reconsidered his choice among Wordsworth's revisions—not always happily, as we think. The proof-reader, also, of the Messrs. Harper, has not always followed Mr. Arnold's punctuation or indention, and has as a rule sternly frowned upon Wordsworth's license in capitalizing. These are risky liberties, but we do not affirm that they have been abused in the present instance.

A great many readers will welcome the amalgamated volume entitled 'Natural Selection and Tropical Nature: Essays on Descriptive and Theoretical Biology' (Macmillan). Mr. Alfred Russel Wallace has united his 'Contributions to the Theory of Natural Selection' (1870-71) and his 'Tropical Nature, and Other Essays' (1878); but in so doing he has retrenched and expanded, partly in the interest of the general reader, and partly to avoid repetition of what he has more fully treated in his other works. Thus he omits entirely "The Malayan Papilionidæ" for the former reason, and "The Distribution of Animals as indicating Geographical Changes" for the latter, and has retained but a portion of "By-Paths in the Domain of Biology." The additions consist of a brief essay on "The Antiquity of Man in North America" (lately emphasized in these columns with fresh evidence by Prof. G. F. Wright), and Mr. Wallace's article in the *Century Magazine* of January, 1888, on "The Debt of Science to Darwin." Everybody will be glad to have this remarkable tribute accessible in book form. Mr. Wallace further illustrates the ethics both of science and of good bookmaking by tabulating the chief alterations and additions he has made. The way of the critic, the bookbuyer, and the student is thus made perfectly clear. The volume is handsomely printed.

'Adventures in Nyassaland' (London: S. Low), by L. Monteith Fotheringham, is an account of the spirited attempt of the agents of the African Lakes Company, aided by the missionaries, to defend the natives about its station of Karonga from the Arab slave-hunters and their followers. Before the war broke out in October, 1887, the plain along the northwestern shore of Lake Nyassa, some four hundred square miles in extent, was "dotted all over with tidy villages and enriched with luxuriant groves of banana, sycamore, and cotton trees." In the course of a few months the region was nothing but blackened ruins, a desolate and silent waste. The Arabs pursued their usual tactics. They were suffered to settle in the country as peaceful traders, and then, when sufficient ivory had been collected for transport to the coast, they picked a quarrel with the unsuspecting natives, raided and burned their villages, capturing the women and older children, but killing the infants and men. The war lasted for two years, during which time the whites, though very few in number, with the aid of their native allies, made many brave but unsuccessful attempts to dislodge the Arabs from their strongly stockaded posts. The story is vigorously told by the person who for the greater part of the time was in command of the station. A few such men, well-supported and posted on the different slave-routes in central Africa, and at the same time offering to the Arab merchants regular trade facilities, would speedily put an end to the raids by which vast regions are being depopulated. Mr. Fotheringham hints that the Portuguese were the instigators of the Arabs in this warfare, and it is very likely that they sided with them so far as to furnish arms and ammunition exclusively to them.

Ginn & Co. have lent their name to Prof. MacFarlane's book on the 'Algebra of Logic,' published in Edinburgh in 1879. It is, we are sorry to say, a wholly misguided and unprofitable work. The author says in his preface: "I consider it proper to state that the theory . . . advanced in this work occurred to me five years ago; and that I have directed towards its development the whole of my subsequent study of the mathematical, physical, and natural sciences which are embraced in the curriculum for the degree of Doctor of Science (mathematics) at the University of Edinburgh." No doubt it is this misdirection of his years of student life that has prevented the author from discovering later how inadequate are his views upon a subject of much promise.

The essay upon the 'Monetary Question,' by M. Boissevain, which received the prize offered at the Paris Monetary Congress in 1889 by Sir H. Meysey-Thompson, has been translated into English, and is now published by Macmillan & Co. Whatever opinions one may hold as to bimetallism, it is impossible not to be amazed that its advocates should have selected such a production as this for the presentation of their case. Scarcely any of its conclusions rest upon undisputed premises, and very little attempt is made to establish these premises by scientific methods of proof. M. Boissevain's strong point is that the general

use of silver as money would create an additional demand for it, and thus increase its value. On the other hand, he exposes himself to conclusive refutation in arguing against those who contend—like Mr. D. A. Wells in his 'Recent Economic Changes'—that the fall of prices in recent years has been caused by a diminution of cost of production. He takes the position that if this were so, there should have been a general augmentation of wealth and prosperity, together with a great commercial and industrial development, whereas, he says, the very contrary has taken place. It is hardly necessary to say that this last statement is utterly at variance with fact. M. Boissevain regards very unfavorably the silver legislation of this country, considering that it must be detrimental to the cause of international bimetallism. His essay, we should add, is moderate in tone and agreeable in style.

A second edition of 'German Socialism and Ferdinand Lassalle,' by W. H. Dawson, is published by Swan Sonnenschein & Co. This work is principally devoted to a biographical history of German Socialism, and is sympathetically done, although the author is a little staggered by some of the details of Lassalle's life.

A work of obvious utility and convenience, just from the press of Ginn & Co., is Prof. Charles F. Dunbar's 'Laws of the United States relating to Currency, Finance, and Banking, from 1789 to 1891.' The compiler has had in view the advantage of students and teachers of political economy, in bringing within ready reach documents which must otherwise be sought in the Statutes at Large with no little labor and weariness. His main divisions are Currency, Finance, and Banking, 1787-1860 and 1860-1891; Coins and Coinage, 1789-1891; and Vetoed Bills, and Other Documents (resolves, ordinances, circulars). He has gone to great pains to extricate sections from laws not directly within the scope of his collection; to abbreviate other sections in laws for the most part quoted textually; to describe statutes summarily which it was not worth while to reproduce even abridged. The arrangement, of course, is chronological, and a table at the end gives a conspectus of the series. Parts I. and II. occupy 220 pages, of which about one-fifth is devoted to legislation down to the close of the last century, and one-third to that since the outbreak of the civil war. Prof. Dunbar's task has been most scrupulously executed, and a bare statement of the nature of it will stand in lieu of praise. The volume is beautifully printed.

The annual report of the State Geologist of New Jersey for the year 1890 is the first by the new incumbent, Prof. John C. Smock. It betokens an energetic conduct of the Survey on the lines so wisely laid down by the late Prof. Cook, and an extension of these in ways sure to be as profitable materially, and to vindicate anew the State's prudence in fostering this branch of its administration. A study of the limestones on the northwest border of the Highlands has revealed unexpected organic remains, which, being referred to the Cambrian formation, open up a lower than the lowest fossiliferous horizon hitherto known in the State. Mr. Nason's report on the iron mines tabulates all that have produced ore commercially, and, by references to previous publications of the Survey, makes the history of each mine readily accessible. A map shows the location of the principal mines. Work in the southern part of the State has determined three terrace formations, old coast lines, together with the area of the ancient estuary of the Delaware marked by the Trenton gravel; and has fixed the constant depths of three underground water-courses available for artesian wells. Researches into water-power are going on, and a map shows the several watersheds of the State, while a list of all water-powers in Northern New Jersey is given. Two new geological maps are in preparation, showing structural geology and surface nature (soil and outcrop) respectively. The U. S. Geological Survey will coöperate in making these.

We have received the second Bulletin of the United States Board on Geographic Names, constituted by executive order of September 4, 1890, to promote a "uniform usage in regard to geographic nomenclature and orthography" in the several departments and publications of the Government. The pamphlet sets forth the principles adopted by the Board, gives a table for transliteration from foreign languages, and an alphabetic list of decisions, with occasional discussions. Most noticeable in the foreign section is the preference of Bermuda to Bermudas, Colon to Aspinwall, Haiti to Hayti, and Tokyo to Tokio.

The second number of the *Quarterly Register of Current History* is the first that has fallen under our eye. It is published in Chicago, and edited by Mr. Alfred S. Johnson, is printed in large open type, and illustrated with cuts of varying degrees of merit. It will no doubt prove a handy compendium for those who wish to keep abreast of the news of the day, but it is not a severely impartial chronicle of facts, as one may see by reference to p. 137, where the cause of Commander Reiter's removal is stated. The statement is quite superficial and incorrect. One might criticise the want of economy in twice recording the deaths of Porter and of Sherman—once in connection with the Navy and Army, and again at greater length in the Necrology.

—The leading article in the June *Atlantic* is that upon Lincoln by Carl Schurz. It belongs to the older and more robust type of the reviews which have now ceased to be written, and, though it is suggested by the late 'Life of Lincoln' by Nicolay and Hay, and starts with some reference to their ponderous ten volumes, it is but little indebted to that work, and soon parts company with it. This is the ancient custom of the days when reviewers were "great," and could have their way with both editors and the public. The revival of the type, however, is unfortunately not to be looked for, even with such a successful example to plead for it as this excellent paper. Mr. Schurz has drawn a portrait of Lincoln in simple great lines, without confusion or overlaying. He has presented the circumstances of the life, the development of the character, the fine human traits and abilities that were permanent in Lincoln's personality, and he has drawn all that eventful life within the compass that admits of a single impression. The paper is in style and treatment the best he has ever done, and the best essay upon Lincoln that we have yet had. In its combination of justice and admiration, especially, it is unique. A second portrait of a very different sort is given in Prof. Palmer's reminiscences of Prof. Sophocles, the Greek who was so long the most striking individuality at Harvard. It was much to be desired that some account of this strange scholar, who had wandered so far from his natural home, should be preserved, and Prof. Palmer had unusual opportunity to penetrate his reserve and seclusion, and to estimate the human side of the monkish scholar who was, for the most part, a humorous curiosity to many generations of Harvard men. These will all feel indebted to Prof. Palmer for his charming paper. Dr. Barrows writes a very encouraging report of a recent visit among the negroes of the South, and dwells particularly upon their material gains, the growing diversity of their employments, their educational progress, and the moral results, already apparent, of this change of condition in their social life. The paper is a primary lesson in the dependence of the higher social sense and its morals upon material conditions in our civilization, which amiable persons with a proneness to Bellamy's crudities might well lay to heart.

—*Harper's* is a routine number, with little that suggests comment. The novelty is Du Maurier's novel, "Peter Ibbetson," about which there will be much curiosity. Mr. Child describes the journey up the river Paraná, Louis Frechette is guide to an excursion to the Royal Châteaux of Blois, Chambord, and Amboise, and Mr. Couch continues his picturesque tour on the Avon. Mr. Besant writes of London after the Romans, and cleverly fills the gap of our knowledge by an imaginary account of the desertion of the city at the invasion of the Saxons. A story by Miss Jewett, an argument in favor of the New England scheme of town government, and a second paper on American Riders, nearly exhaust the list of contents.

—*Scribner's* brings a really "Parisian" article, from the pen of Sarcey, upon the Boulevards. He attempts to render, not the exterior of the promenade, the cafés, shops, kiosks, the figures of the pavement and the roadway, but the spirit of the thing, and he succeeds perfectly in humanizing the street. The scene is interesting to him only so far as it is inhabited; the customs of its population from hour to hour, and especially its most highly developed type, the *boulevardier*, are his subjects, and they are sketched with a lifelikeness and a vivacious sympathy that well express the heart of the lover of Paris. Such sentiment, as soon as a past begins, has always an element of regretfulness, and M. Sarcey laments the boulevards of his fathers cordially enough; and he feels obliged to begin the elegy over the decaying "boulevardier," who is passing away, he says, and flourishes last in his fulness in the person of his friend Aurélien Scholl. The cafés of the literary and artistic sets are already gone; but the life of the pavement from the Opéra to the Rue Montmartre is as exuberantly fertile as ever, and takes on its new forms for the new generation. The attractiveness of this paper, its fine literary quality, is its humanity; it reads like a scene from the real play of life. A second very human article is Mr. Evert J. Wendell's account of the Boys' Clubs of this city. He does not give a statement in detail of their organization and management, and generally he makes few practical suggestions that might be of service to others in starting these clubs elsewhere; but he describes the nature and habits of the boys, their temperament and circumstances, and the way they take these efforts in their behalf, and he makes very plain the excellent and abiding results upon their characters and careers. It is a service to bring so deserving a charity more into public notice, and the article should result in increasing the number of these radiating centres of juvenile reform.

—The *Century*, in an admirably illustrated paper upon Col. William Byrd and his seat at Westover, gives an account of the life of a colonial Virginian and his family in England which is the more interesting because an authentic narrative of this phase of early Ameri-

can life, which attracted Thackeray's mind, is rare; and the picture is completed by the companion sketch of his life on his plantation, with extracts from his diaries. Besides this exceptional contribution, the number contains nothing more notable than Prof. William M. Sloane's presentation of the history of pension legislation and the social tendencies involved in it. The subject does not admit of novelty at this stage, but the author has forcibly stated the leading facts and drawn the usual argument from them. The instalment of the Talleyrand memoirs gives his denial of complicity in the execution of the Duc d'Enghien and in the alleged Maubreuil plot to assassinate Napoleon. The issue left, as Minister Reid remarks, is a choice between the word of Napoleon and that of Talleyrand as regards the first incident, and the account of the second is incomplete. Minister Dallas's Russian diaries afford the same sort of reminiscence as in the previous number. A paper on the University education of women in England, in which the history of the movement is sketched and cuts are given, closes with a valuable note on the health results, so far as experience has yet allowed of statistics. There is a plentiful supply of the usual fiction.

—The Royal Geographical Society's Proceedings for May opens with an account of a fifty days' journey from Tong-king to Canton, the greater part of the way by the Si-kiang or West River. Although this stream is navigable for vessels of eight feet draught for 200 miles above Canton, that city is still the terminus of steam navigation. The author, Mr. A. R. Agassiz, an officer of the Chinese Imperial Maritime Customs, attributes this fact, by which the cost of all foreign goods in the interior is greatly increased and their quantity correspondingly diminished, to the opposition to steamers of the vast floating population of Canton and the surrounding districts, whose carrying trade would be nearly destroyed by the introduction of them. He believes, contrary to the general opinion, that the influence of the lower classes upon the Government is very great, and that the official fear of popular disapproval is the leading motive preventing the opening of the West River to navigation. This will very likely be brought about, however, in self-defence by the proposed construction of the French railway from the head of navigation on a branch of the Red River to the Chinese frontier, whence there is continuous water communication to Canton, thus probably insuring France a large share of the foreign trade of the western provinces. Mr. J. R. Rainey contributes an interesting account of the Sundarban, the lower portion of the Gangetic Delta. This is a tract nearly 8,000 square miles in extent, in great part covered with impenetrable forest and jungle, and intersected in every direction by streams or creeks. During the rainy season the main streams have double currents, "that is, the surface down to a certain depth flows downward or southward, while below that depth the tide advances upward or northward. This is caused by the freshets sweeping down from a higher level and overtopping and passing above the flood tide from the sea." Although this region is now very sparsely inhabited, at no very remote period it appears to have sustained a very large population, as is shown by the "numerous ruins of brick-built houses and temples, and extensive tanks scattered all over the Sundarban." One of these is the "mansion of seventy-seven domes," with twenty-six arched doors on the four sides opening into a vast hall 140 feet in length by 96 feet in width, its many-domed roof being supported by sixty pillars. The cause of the depopulation Mr. Rainey, who cultivates a large estate in the district, believes to have been the shifting of the bed of the lower portion of the Ganges from the west to the east a few centuries ago, by which the streams in this portion of the delta, being deprived of the greater part of their fresh water, have become brackish and unfit to drink. The cultivated districts contain the finest rice fields in all India, and much additional land could be reclaimed to the great advantage of the country, especially in the case of famine, since "the rice crop there does not depend so much on rain for its growth as it does in other less favored and less fertile parts of India."

—Kluge's 'Etymological Dictionary of the German Language' has at last been translated into English. It is very carefully done from the fourth edition by J. F. Davies, and published by Geo. Bell & Sons, London. It is true that nearly all who have occasion to use Kluge must know German enough to need no translation. But not a few are bothered by the many abbreviations in the original, and the meanings of the rarer German words which the translator has accurately rendered will be welcome to a great many. German "Umbildung" has been rendered by "corruption," which is a tabooed expression in modern philology. It is interesting to watch how certain expressions much used by progressive German investigators enter the English vocabulary; *e. g.*, "Ausgleichung," "Angleichung," "Lautwechsel," "Lautwandel." Sweet in his works on English, Wright in his translation of Brugmann's 'Grundriss' and in his O. and M. G. Primers, Brandt in his German Grammar, Wheeler in his 'Analogy,' were the first who used these terms in English. The form, arrangement, and type of the English book are all that could be desired. When the English cognate very nearly renders the German word, the translator might have indicated this fact by a different type or by a symbol, as has been done in Whitney's Dictionary and Brandt's German Reader. This would have saved time and space. Under "Zweig" cognate "twig," "Almosen" cognate "alms," and in a thousand other cases, there would have been no need of repeating the English words. Comparing the English page with the German page, one is annoyed by the prominence which English custom gives to proper names by printing them in capitals. O H G., Mid H G., Mod H G., Mod E. have to be repeated so often that they attract the eye immediately, and the word-form seems lost among them.

—'Shemitic and Other Glosses' to Kluge's Dictionary, by the Rev. Dr. Muss-Arnolt, is deprinted (*sic!*) from *Modern Language Notes*, vol. v., No. 8. The pamphlet, printed on pages with wonderfully broad margins, contains some valuable additions of words of Shemitic origin. The author's tone is objectionable. On p. 58, for example, he says, "Kluge should study," etc., and then follows a reference to the Göttingen *Gelehrte Anzeigen*. Dr. Kluge is a very young man for his wide reputation, but the Rev. W. Muss-Arnolt (Ph.D. Johns Hopkins) should not patronize him so much. Many words which this critic expected to find have been properly omitted, in the opinion of many. Great bulk is the curse of many a valuable book. The charge that Kluge and his publishers were not morally entitled to print the claims as to completeness, etc., in the announcement of the work, will not appear well founded to any one who has had experience in treating a whole language in grammar or lexicon. The author has to treat not merely what is known and interesting to himself, but also the unknown, the unattractive, the cruxes, and, worst of all, the hobbies of a specialist.

YRIARTE'S MONUMENTS OF THE BORGIAS.

Autour des Borgia. Par Charles Yriarte. Paris. 1891.

'AUTOUR DES BORGIA' contains all available information as to the monuments relating to the three historical personages, Alexander VI., Cæsar, and Lucretia, which have withstood the ravages of time or the hatred of mankind. It is a singular fact, and one intensely significant of the detestation their very names inspired, that not a vestige of the last resting-place of any of the three can be positively certified. Pope Alexander VI. may be buried under some nameless stone in the crypt of the Vatican; the account of the neglect his corpse was treated with the very day of his burial almost confirms any hypothesis, and the custodians of St. Peter are in the habit of suppressing the name of Borgia when they show and enumerate the sepulchres of their Popes. At Ferrara, in the Church of San Francesco, the burial-place of the Dukes of Este, there is no record whatsoever of Lucretia, though at the Court of Ferrara no scandal tarnished her life. It is as though the Dukes of Este regarded as a misalliance the marriage of one of their race with the daughter of the Spaniard who ruled at the Vatican and made free use of the Roman Church, its riches and its privileges as of a family inheritance for the good of those of his own blood. A splendid monument was raised to Cæsar by Don Juan of Navarre when the former died in Spain in 1507. It is described by Don Antonio di Guerara, Bishop of Montenedo in 1523, as very richly ornamented about its urn, on which in high relief the kings of Holy Scripture are lamenting the untimely death of Cæsar. In the beginning of the eighteenth century, when Père Aleson, wishing to continue the annals of Navarre begun by Moret, entered the church at Viana, not a vestige of the monument so accurately described remained. He learned on inquiry that at the end of the seventeenth century a Bishop of Calahorra, the head of the diocese of Viana, had protested that the ashes of Cæsar Borgia were a profanation of any Christian church, so he ordered the monument to be destroyed and the bones to be scattered to the winds.

Yriarte, not being at the time cognizant of the diary of the Bishop of Montenedo, first sought Cæsar's tomb at Pampeluna, where the chronicle of Moret places it. At Viana he learned the above-mentioned facts, and a careful search only furnished a few débris which possibly had belonged to the monument. Nothing daunted, he turned for aid to popular tradition, and learned that since the beginning of the eighteenth century a record had been handed down from father to son that those who had orders to scatter Cæsar's bones, fearing to cast dishonor on one made in the image of their Creator, had reburied the skeleton under three steps of the terrace of Calle de la Rua opposite the porch of the church. Through the energy of Yriarte the place was excavated and an entire skeleton found two metres underground, protected by uncemented bricks. After the Alcade in charge had identified these facts, the place was bricked up and left as before.

Other interesting records, hitherto unknown,

concerning Cæsar's imprisonment at Chinchilla, and the details of his marriage with Charlotte d'Albret, came to Yriarte's knowledge in his journey through Spain following the traces of his hero. In Italy the pursuit of fresh matter was more difficult, so completely had the Della Roveres succeeded in effacing everything the Borgias had left their seal on. There was a personal hatred between Julius II. and Alexander VI., so great that when Julius succeeded to the papacy he declared that nothing would induce him to inhabit the splendid apartments then called the Vatican, decorated by Pinturicchio, who had introduced a portrait of Alexander VI. in one of the compositions. "That *Marane*, that Jew, that circumcised one," he called his predecessor. Julius's love of art was so genuine, and his appreciation of Pinturicchio's work so great, that he refused to let the hated portrait be effaced or anything changed, but he had the rooms sealed up and dwelt on the floor above, which was subsequently decorated for him by Raphael. So the Borgia apartments remain to this day the most important monument of that ill-fated race, although, unfortunately for its perfect preservation, it did not long remain as tranquil as under Julius II., for in 1527, during the pillage of Rome, so destructive to innumerable works of art, the lancers of the Cardinal of Bourbon occupied the rooms for nine months, and we read that the Vatican was full of horses and soldiers, and that even the high altar in St. Peter's was bespattered with blood and the ground around it strewn with dead horses. The rooms do not seem to have suffered much from the rough use the lancers put them to as to the ceiling and frieze decorations. They were restored in the latter part of the sixteenth century, for it was only in 1585 that Sixtus Quintus left them definitively to live in the palace of San Damaso, which has remained a pontifical residence. For many years they were then used only when need of more space was required, in the holy week or even at conclaves. Pius VII. wished to turn them into a picture-gallery in the beginning of this century, and to adorn them with certain fine examples of sculpture; but they were so ill adapted, by the extreme richness of their decoration, to this purpose that in 1840 the pictures were removed and the rooms were used as an annex of the Vatican Library.

The Borgia apartments have been practically closed to the public for half a century. Stendhal, who knew Rome so well, never saw them, and Herman Grimm, the great German critic, who spent many years in Rome studying the Raphael *stanze* just above them, was never able to see them. Leo XIII. has formed plans for the restoration of the pavement with painted tiles copied carefully from the ancient ones still remaining in the Torrione Borgia; the frescoes, with their stucco reliefs, will also undergo a most cautious dusting, and a collection of ancient stuffs, ecclesiastical plate, and vestments will be displayed there permanently for the advantage of visitors to the Vatican. Unfortunately, changes in this quarter are very slowly brought about, and at the present moment the spaces between the frescoes and the floor, formerly hung with delicate tapestry, are filled with book-shelves crowded so that they overflow on the floor and window-seats in utter confusion, and make it impossible for tourists to be taken around in the ordinary way. Through the courtesy of Mgr. Carini, all-powerful in the Vatican Library, some favored few are allowed a hurried visit, under the guardianship of a guide who allows no one to lag behind.

Though the compositions and decorations are so full of invention, they demand very attentive examination of all interested in decorative art, of which they are the finest examples we possess in such entirety. We turn, therefore, with great interest to Yriarte's chapter on this subject. The little outline drawings illustrating the text are very useful to make clear the compositions described. The larger photographs, reproduced from bad negatives, are very confused and unsatisfactory, but the difficulty of obtaining even these was extreme. The portrait of Alexander Borgia in color, especially copied from the frescoes for this volume by a *prix de Rome* painter of the French Academy, is wanting both in the character of Alexander's head and in the reproduction of Pinturicchio's manner; it may be looked upon as a translation from the purest quattrocento to nineteenth-century impressionism. Yriarte complains that he has not been allowed sufficient leisure to make a complete study of the frescoes, and hopes that some later student will complete the work, carrying it further. In all times, each Pope had a great desire to perpetuate his memory by adding to the buildings around the sanctuary protected by the great cupola which Michael Angelo designed. Many of these monuments to fame had to disappear in due course to make room for their successors.

"In the fifteenth century a Pope of artistic proclivities, Nicholas V., had conceived the vast project of grouping all the services around the Sistine and St. Peter's, and to this end he invited Bernardo Rossellino and Battista Alberti to his aid. Death, however, overtook him, and Innocent VIII. tried to continue this great work, but he also left it incomplete, and Alexander VI. (Borgia), the successor of Innocent, instead of continuing the beautiful designs of the great artist of the Proto-Renascence, interrupted the general scheme, and, appropriating what was complete, resolved to join it on to the basilica by a splendid portico of three orders of multicolor marbles, whence the pontiff dominating the Leonine City should give his blessing on feast days."

The Borgia tower and the Borgia apartment are but a corollary of this project, which was realized, but of which only a portion remains. Paul V. (Borghese) destroyed the portico mercilessly in order to give a new façade to St. Peter's; it is only by examining the original plans and the drawings of the architects kept in the Library of the Vatican that one can understand what the extent of Alexander VI.'s work was. The famous underground communication from the Vatican to the Castle of St. Angelo was made by him and served him when he fled from Charles VIII. of France. His son Cæsar, at the death of Alexander, escaped from the Orsinis and the Roman barons leagued against him through this same passage. It was also Alexander who enlarged the little winding streets of the Leonine City, between the Vatican and Rome, and made a splendid road, the inauguration of which was considered an event important enough for a commemorative medal.

The six rooms the Pope chose for his personal use were given over to Bernardino Betti, usually known as Pinturicchio, to decorate. He worked there with several pupils from his own *bottega* between 1492 and 1495. In the "Resurrection," Pinturicchio has painted Alexander VI. at the feet of Christ, in full pontifical vestments, gloved hands on which the fisherman's ring can be distinguished, the tiara on the ground at his feet. The Christ, draped in a white transparent veil, is surrounded by rays of light; he holds a shield on which is a red cross, the emblem of his blood having been shed, while a burning flame to the right symbolizes charity. On the left side of the composition the landscape is dark, a cypress tree and a rock against which the Pope's figure is relieved, while behind the Christ is a pale olive tree. It is evident that Vasari had never seen with his own eyes these works of Pinturicchio, and only went on hearsay—then, as ever, unreliable—when he narrates that Alexander had himself painted kneeling before the Virgin, represented in the form of his mistress, Giulia Farnese. The cautious and effective use of relief is very noticeable in these compositions. We see it only in the sarcophagus of the Virgin in the "Assumption," and in the pontifical robes of Alexander, besides a few accessories.

Yriarte brings state documents before us to show that in the "Dispute of Saint Catherine and the Doctors before the Emperor Maximian" the popular tradition that in Maximian we have a portrait of Cæsar Borgia, as in Catherine one of Lucretia, is completely erroneous. Cæsar was then seventeen years old, while Pinturicchio's Maximian is a bearded man. Yriarte inclines rather to it's being Don Giovanni, Duke of Gandia, who was so cruelly murdered in 1497, and who at that particular moment was his father's favorite; but he remarks that the same head is recognizable as representing Frederick III. in Pinturicchio's frescoes in the library at Sienna, where there would be no reason for portraying a Borgia. The Oriental costumes in this composition are very splendid. The court chronicle of the time relates that the unfortunate Djem or Zizim, brother of the Sultan Bajazet, banished on account of his conspiring, was a hostage and prisoner at the Papal Court with a retinue of Circassians and Moors, and we have an account of how Alexander, who loved pageants, would ride out with Djem on his right, and his son, the Duke of Gandia, in full Oriental costume, on his left, preceded by Moors leading fresh horses as relays, and cloaks for their use; and in all descriptions of feasts and processions at the Vatican we read of Djem and his Circassian guard in prominent positions, so that Pinturicchio without doubt must have made use of the picturesque material constantly before him. He probably introduced portraits, but there can be no positive identification of any of the figures.

Of Cæsar Borgia the first portrait considered is the famous so-called Raphael of the Borghese Palace in Rome, now generally acknowledged to be neither a Cæsar nor a Raphael, the costume being that of the late sixteenth century. It is curious that no document exists explaining how this fascinating picture got into the Borghese collection. Yriarte gives most interesting written descriptions of Cæsar's appearance and demeanor collected from the writings of those who came in contact with him. The only portrait of him which Yriarte judges to be trustworthy is the engraving in the volume of Paul Jove's 'Elogia Virorum Illustrium' under his biography. This was published in France in 1551 by Torrentini.

The sword of Cæsar Borgia forms the last, most important, and most romantic chapter of the book. Yriarte considers this sword a most valuable document as to Cæsar's state of mind while still a cardinal, and Gregorovius mentions it thus: "The Duke of Sermoneta possesses a sword which belonged to Cæsar Borgia, decorated with engravings so full of allusions to the ancient Cæsar that one can understand what ideas were simmering in the Cardinal's mind." We only possess its history since 1734. It must have been executed between 1494 and 1498. The grooved blade is 1m.025 long by 0m.83 at the hilt; it is gilt

about a third of its length, and divided on each of its sides into four compartments, of which each is the frame of an engraved subject. The sheath of this splendid sword is no less remarkable than the blade. Curiously enough, it forms one of the treasures of the South Kensington Museum, and must ever remain separate from the blade for which it was destined; indeed, everything shows that the sheath had not left the workshop of the artist, and had not even been properly finished, a small part of the designs having been merely traced on the boiled leather, and the place for the hilt not having been cut. On the sheath we find three monograms identical with those on Cæsar's sword; the tongues of fire which were added to the Borgia arms in the thirteenth century cover the ground; and besides the most exquisite decorations of cornucopias, eagles, scrolls, masks, helmets, there are several compositions executed in relief worthy of the greatest Renaissance masters. In the South Kensington catalogue this work is attributed to Antonio Pollaiuolo; but Yriarte, by pointing out the similarity of certain figures and parts of the composition to the frescoes in the Vatican rooms, and showing by documentary evidence that Pinturicchio was for many years the painter Cæsar Borgia had attached to his person, convinces his readers that the subjects of both the sword and the sheath were suggested to Pinturicchio by Cæsar Borgia himself, and that the sword was ordered for the great ceremony of the crowning of Frederick of Aragon at Naples in 1497, where Cæsar went as the Pope's representative in all pomp, with the attributes of temporal and spiritual power. This was just as he was contemplating breaking away from the Church. Yriarte, who has also found most interesting documents concerning Ercole de Fideli, the celebrated goldsmith who made the sword, shows for our comparison other weapons from famous European collections by the same Ercole, so that we may see how much finer the style of composition and the type of the nude are on Cæsar's blade and sheath which also bear the name of Ercole.

The evidence is very convincing, and the conscientious research and indefatigable zeal with which Yriarte studies every detail, every possible hypothesis concerning his subject, inspires his readers with confidence, and keeps up their interest to the end. The book is so full of documents relating to mediæval history, and is of such importance and size, that it is impossible to give any adequate idea of its value in a brief review.

The Story of Wisconsin. By Reuben Gold Thwaites. [The Story of the States.] Boston: D. Lothrop Co.

The Story of Kentucky. By Emma M. Connelly. [The Story of the States.] Boston: D. Lothrop Co. 8vo, pp. 332.

It is no fault of Mr. Thwaites that the story of Wisconsin is not especially responsive to the treatment which he has wished to give it. The history of this State, as of its neighbors, is but part of a not easily divisible whole—the Northwest. The evident intention to distinguish continually between story and history limits the book, as it has others of this naturally popular series, too sharply to a romantic aspect of its subject. There has been thus far in the five volumes already issued a tendency to sacrifice congruity and orderliness of narrative for the sake of rescuing from natural obscurity a number of glowing but comparatively trivial details. The romance of history in this country is not necessarily to be woven from the exploits of hardy individuals, or from the grandeur of the untouched landscape of earlier days. Abundant opportunity for the play of fancy can be found in an adequate appreciation of the first combined efforts of earnest characters to build up in patience a political system, or to win by great sacrifices liberty of all kinds for themselves and for the future. There will naturally intervene between ourselves and the past an atmosphere so suffused with sympathy that it softens the outlines of events in all probability hard and prosaic enough to them who were of the times.

These most obvious reflections have been excited by the creditable exertions of Mr. Thwaites to do something which he could have done very much better in another way, for he is fully competent to write a history either of Wisconsin or of the Northwest. As it is, he has sought honestly to breathe the breath of life into the meagre narrative of a pioneer life which was mainly the struggle of men uninspired by a common object, except gain or the conversion of savages to the usages of a formal religion. One must sooner or later tire of the mournful solitude of the primeval forest, while the ascent of one new river is not wholly unlike that of another. The *courreurs de bois* charm at first by reason of their free and open life, but appear soon in their actual sordidness and rapacity. Neither scenery nor the lives of picturesque adventurers can long claim interest except as skilful adjuncts. On the larger canvas of Parkman these things, of course, have their relative place. Even well on in his story Mr. Thwaites has seemed to feel impelled to introduce personal anecdotes in no wise essential to preserve a continuity of narrative, and interesting only as a daily sensation is sure to be. Too much space is allowed, for instance, to the "Barstow and the Balance" episode.

A most rapid summary of the deeds of the Wisconsin regiments in the Civil War—and none were more valiant—is well done, as are also the chapters on the social and educational development of the State. The Indians, even the troublesome Winnebagoes, are justly treated, while the rapid sketch of the Black Hawk war shows what Mr. Thwaites might easily have done had he suffered romantic incident to take care of itself and kept to old historical lines. "Materialized" and "bitten" are such new words in accepted literature that it perhaps would have been wiser to quote them, as Mr. Thwaites has done with "boom town."

Mr. Bridgman continues to illustrate the series; some of his work, as usual, is interestingly original, but there is a plate opposite page 164 which looks as if it were done by a child five years old.

'The Story of Kentucky' by contrast is not merely a gossipy, picturesque boys' and girls' history of the commonwealth whose name it bears, but there is a "story," altogether fictitious, carried through four generations from the pioneer christened by the authoress "Edmund Cabell," who leaves Virginia in 1774 and is made a companion of Daniel Boone, down to his great-granddaughter Cornelia, the "typical Kentucky girl of 1890." Along with it marches, side by side, a very loose sort of a history of Kentucky, based mainly on the works of Lewis Collins and Prof. N. S. Shaler, with some quotations from Charles Dudley Warner.

The name "Cabell" given to the early hero may delude some readers into the belief in the reality of the personage, since it was the middle name of one of the most prominent figures of Kentucky (John Cabell Breckinridge); and this is a pardonable trick which Miss Connelly may have learned from the realistic school of Zola and Daudet. The adventures of the early hero are such as are generally found in the boys' books about Indian fighters that were the joy of our youth forty or fifty years ago. Although the writer is a born Kentuckian, she does not succeed in giving much local coloring to the manners and conversation of her Kentucky gentlemen and ladies of the second, third, and fourth generations. The historical part of the book, which is inextricably intermingled with the fiction, in accordance with the title and object of the series, addresses itself to the youthful mind, and passes over the details of political and forensic struggles (such as the contest between the Old Court and New Court party), to dwell upon heroic deeds and the description of beautiful landscapes. Some of the woodcuts, copied from paintings of Kentucky scenery, are thoroughly good, perhaps the best part of the book.

To criticise the book in its details, on the score of inaccuracy, would be utterly useless. The writer evidently has not the historic bent: slips in dates, names, and incidents occur on almost every page. For the entertainment of boys and girls between twelve and seventeen, however, the 'Story of Kentucky' is as good as many so-called holiday books, and the tone is healthful and strictly moral. Miss Connelly could have enlivened the short passage of her story that deals with the "Spanish intrigue" and with the partisan warfare between John Brown and Humphrey Marshall very considerably by drawing freely upon the monogram of John Mason Brown ('The Beginnings of Kentucky'), which is based altogether upon original documents, and is written more for private circulation than for the general reader. Miss Connelly is mistaken in believing that about the year 1800 a tone of infidelity prevailed in Kentucky (p. 133). There were a few prominent lawyers and politicians (among them Humphrey Marshall) who, like Thomas Jefferson and other leading Virginians, openly rejected Christian beliefs, and there were many rough characters who rejected all religion as an irksome burden; but the mass of men and nearly all the women were intensely religious, so much so that the excitement at protracted church meetings in 1803 led to an hysteric disease, the "dancing epidemic," which did not come to an end for two or three years. Coming down to the present state of men and things, we think Miss Connelly pays a somewhat undeserved compliment to the population of the Cumberland Mountains (p. 267). She says that "the larger and better class are of English, Scotch, Irish, and German origin; honest, courageous, kindly"; and further on she says, on Mr. Gilmore's authority, that the man of this class "labors, is industrious, hardy, enterprising, a law-abiding and useful citizen"; while the second class, of which there are only *a few* in the Kentucky mountains, are a sallow, gypsy-like people of unknown origin, idle, vicious, thoroughly conscienceless, and "far more incorrigible" than either the Indian or the negro. Prof. Procter, the Kentucky State Geologist, gives it as his opinion that the latter class is descended from "indentured servants in Virginia and North Carolina, whose fathers had been serfs or villeins in England for a thousand years, and that their bad traits are the result of "poor stock." Miss Connelly may never have heard this opinion or may not believe in it if she did; but we fear she is wrong in speaking of any of the mountain people as enterprising, and in speaking of the "sallow, gypsy-like people" as being "only a few." It is to be hoped that mines, furnaces, and railroads will crowd them out.

To make up for the romance running through the text, Miss Connelly winds up her book with twenty-five pages, in small print, of a dry, chronologic summary from "prehistoric times" down to the meeting of the Constitutional Convention in Frankfort, in September, 1890, and a summary of the Constitution of 1850 is printed by way of an appendix.

The Old Navy and the New. By Rear-Admiral Daniel Ammen, U. S. N. With an appendix of Personal Letters from Gen. Grant. Philadelphia: J. B. Lippincott Co. 1891.

THIS volume, dedicated "to the officers and men of the old navy, who had to learn their profession as best they could," comprises the reminiscences and experiences of Rear-Admiral Ammen during a naval career embracing now a period of nearly fifty-five years. Few officers of the United States Navy have been more zealous and capable or rendered more valuable and intelligent service to their country in time of war and peace than Admiral Ammen. His interest in modern naval design, his connection with ocean surveys, and above all with the interoceanic-canal questions, will link his name with the new navy as well as with the old, and closely identify his career with the later times and progress of the service. In fact, his activity in professional and other matters has continued in an exceptional manner long after his name was placed upon the retired list of the navy.

To the general reader the interest of these pages will doubtless be heightened by the personal friendship shown to exist between the Admiral and Gen. Grant, whose life the author was the means of saving when they were boys together in Brown County, Ohio. An appendix, prefaced by a portrait of the General, contains a number of letters written by Grant to the Admiral at various times after the outbreak of the civil war.

The first chapters of the book, devoted to the early naval life of the Admiral as midshipman and lieutenant, have a decided sea flavor, like Marryat's tales, and often seem to have been written for the benefit of the younger officers of the service, to whom they should be both interesting and instructive. The Admiral's advice in places becomes so practical in its nature as to include sage remarks as to the advisability of keeping receipted bills, and the payment of tailor's debts. It is no more than just to add that this advice is extended both to the army and to civilians. Notwithstanding occasional discouragement from unpleasant cruises or unsatisfactory prospects of advancement, Ammen was a cordial lover of his profession, and lost no opportunity to improve himself in its various branches, now by modern progress so greatly extended. From his skill and service as Navigating and Coast Survey Officer, he was much employed in duty of that nature, which gave him an experience that added greatly to his efficiency during the civil war, and also to the value of his services as Chief of the Bureau of Navigation in his later years.

It was his good fortune in early life to be associated with Rear-Admiral, then Lieutenant, Du Pont, and he naturally became one of what was known as the Du Pont school of officers—a body of men forming the cream of the navy before the war. In the volume written by Ammen for the war series of the Scribners, 'The Atlantic Coast during the Civil War,' he testifies in glowing terms to the admiration in which Du Pont was held for his elevated and dignified character, as well as for his professional skill and accomplishments. It is to be hoped that the relatives of Admiral Du Pont, who have in their possession a great amount of rich historical material, regarding both the Admiral and contemporaneous naval life, will not postpone too long its publication.

Owing to his absence upon the China station, then vastly more remote than now, the author took no part in the Mexican war, seeing his first actual war service in the civil war. In 1850 he went to Europe on leave, joining afterwards the Mediterranean squadron. The narrative covering this portion is interesting and at times quaint, and proves him to have been a close observer. We doubt, however, the correctness of his opinion, given in one or two places in the book, as to the limitation of the development of yellow fever at an elevation of two thousand feet above the sea. The experience of English troops in the Blue Mountains in Jamaica proves the possibility of this fever at a higher level.

It is interesting, in the light of recent events, to note the usage of naval officers in past times towards political or other refugees when within municipal and foreign jurisdiction. On page 247 the author speaks of an incident which occurred to him when lying at anchor off Cayenne in French Guiana, as follows:

"When in charge of the deck during the mid-watch, I was somewhat startled by the appearance of a man in the gangway, who stepped on board. I asked him who he was, and what was the object of his visit. He said he was a political prisoner, exiled after the *Coup d'état* of Louis Napoleon. He was an educated man, spoke English fairly, and supposed that he had attained his freedom through reaching the deck of one of our national vessels. I had to dispel this illusion, and told him that we were in a French port, enjoying its hospitalities, and could not think of violating our obligations. He insisted on the Captain's being informed of his presence and his demands, which was done—of course without result favorable to his ideas. At that time criminals of all kinds were banished to Cayenne; whether this man's story was true or false mattered not, whatever our individual sympathies might be."

The Admiral, then a lieutenant, was on duty in Baltimore at the outbreak of the war, and left that city during the first tumultuous days on horseback for Washington. He was soon on duty afloat, and attained his first command, the *Seneca*, in time to take part in the Port Royal expedition under Admiral Du Pont. His part in this expedition was performed with credit, and shortly afterwards he was transferred to a double-ender, and then to a monitor, participating in the first attack upon Sumter, under Du Pont. As one of the commanding officers of the monitors, at the request of the Navy Department, he joined in a report to the Secretary as to the qualities and defects of these vessels in action. This report was not well received at Washington, as the Department and the iron-manufacturers were committed wholly and unreservedly to this type of vessels. In view of recent attempts to magnify the war efficiency of the monitor, it would be well for students of our naval policy, especially as to construction, to read the report carefully, headed as it is by the signature of Rear-Admiral (then Commander) John Rodgers.

As Chief of the Bureau of Navigation during the Administration of Grant, Ammen embraced every feasible opportunity to extend the work of the navy in time of peace. By his assistance and encouragement, Belknap made his successful deep-sea sounding cruises in the Pacific; the accurate determination of longitudes by telegraphy was commenced; improved methods of signalling were adopted, and designs and plans made for a coast-defence vessel known as the Ammen ram, which is now being constructed.

One of the final chapters of the book is devoted to the question of the Interoceanic Canal, and no one person, in or out of the service, is entitled to speak more positively and intelligently upon this subject than the author. For more than twenty-five years he has advocated its practicability and desirability, directed surveys for its location, weighed the advantages of the various routes; and, when finally convinced of the superiority of the Nicaragua route, he became its champion with an energy, tenacity, and pugnacity that are beginning to have their reward in the actual construction of the canal.

The Indian Mutiny of 1857. By Col. G. B. Malleson. 1890. Scribner & Welford.

COL MALLESON'S 'Short History of the Indian Mutiny' gives a compendious narrative of a brief, tragic, and very memorable episode in the history of British India. For a century the English had been building up in that country an immense foreign dominion; and in this enterprise they had been willingly and loyally served by a native Indian army, which necessarily grew as the English possessions increased, and which had of late been recruited mainly from Northern India. In 1857, a few years after the conquest of the Punjab, which completed the empire, the whole of the Northern army suddenly broke into open mutiny, shot down their officers, killed all the English, men, women, and children, that fell in their way, seized Delhi, upset the Government over a wide area, and were only subdued after a bloody and desperate contest. At Delhi and Lucknow the representatives of dispossessed dynasties joined and headed the revolt; while throughout the finest provinces of Upper India all the smouldering embers of disaffection and barbarism blazed up. The English, taken by surprise and at first nearly overpowered, faced their assailants boldly; they led the fighting tribes of the Punjab, the Sikhs and Pathâns, against the high-caste Hindu sepoys; they retook Delhi, held on to Lucknow, and thus managed to keep their feet until reinforcements arrived from England, when the outburst subsided and was rapidly suppressed.

Such a story can never fail to excite the keenest interest, for it is full of tremendous disasters and hardy exploits, hairbreadth escapes and savage massacres; it should be read and remembered by all English-speaking peoples, and Col. Malleson tells it in a vivid, enthusiastic style. We must make due allowance for military and patriotic fervor; nor should we be too critical upon our author's habit of crowding his narrative with personal and particular details, with anecdotes of valorous deeds, with praise of various regiments, and with the names of a multitude of local heroes whom he desires to rescue from oblivion. All such things make pleasant reading for those who are already familiar with and love to look back upon the scenes, events, and personages of that time; but there are countries where almost as little is known of Indian geography as of the Indian army list, and the copious array of comparatively unknown names and places may embarrass a later generation of readers, who may wish that minor incidents and the by-play of subordinate actors had been thrown more into the background. Thirty pages, for example, are all too short for adequately describing the siege and storming of Delhi—a most brilliant feat of arms, which was the turning-point of the whole struggle; yet nearly one page is devoted to an encounter

between Lieut. Hills and three horsemen, in which Hills got a cut "that clave his skull to the brain," though he is miraculously revived in a footnote.

How did the Indian mutiny come to pass; what were its principal causes, the lessons that it taught, and the warnings it gave? On these points Col. Malleson's views and conclusions may be usually though not unreservedly accepted. Every one has heard of the greased cartridges, which produced among the Brahminized Hindu sepoys a wild terror of some plot invented to take away their caste, so that they broke out into murderous revolt. But we all know that insurrections which begin in some small matter must have been fomented by larger and deeper circumstances—just as a gun must be loaded before a touch on the trigger can explode it; and in 1857 the Bengal Army was heavily charged with explosive material, and otherwise in a highly excitable condition. The sepoys disliked the dethronement of the King of Oudh, for many of them were his subjects; the conquest of the Punjab had overthrown the last native State that could cross swords with the English, and the sepoys believed that if the English were masters of India, they held it by the good will of the Bengal Army. Nothing is more common in Asiatic States than a mutiny of the troops; the ruler lives in perpetual fear of them. As they are strong, so they wax dangerous, and the East India Company had to crush its own mercenaries much as the Sultan and the Khedive had to destroy Janissaries and Mamelukes. Long before the Indian sepoy actually mutinied it was known that he had become insolent and insubordinate, that discipline had become relaxed and petty grievances magnified; but it was the unfortunate distribution of the suspicious cartridges that united all the regiments in a common conspiracy.

All this is well explained by Col. Malleson, who also shows how Lord Dalhousie's arbitrary annexations of territory had alarmed the native chiefs and had raised up against the English many bitter and influential enemies. He also insists repeatedly upon the discontent and deep hostility excited against the British Government by certain measures affecting the rights of the agricultural village communities; but here he is evidently writing upon a subject which he totally misunderstands. There is no doubt, however, that some very injudicious interference with the powerful landlords in Oudh set the whole class against the English just before the insurrection began, and that many of the British laws and administrative regulations, especially the coercive processes against debtors, were extremely distasteful to the people at large, who much preferred the loose, disorderly ways of their ancestors. In this sense, Col. Malleson's statement, that "the determining cause of the Mutiny of 1857 was the attempt to force Western ideas upon an Eastern people," need not be disputed, although it would be more precise to say that the sepoys revolted because they had got out of hand, through over-indulgence and mismanagement, and that they were joined by certain classes of the population who had lost power and influence under British rule, or who preferred Oriental laxity and lawlessness to the stiff régime of incorruptible but uncongenial foreigners. Strict execution of the laws, enforcement of punctual revenue payments and of private liabilities, a good police and a well-disciplined soldiery are all Western ideas which cannot be impressed upon Asiatics without a certain degree of compulsion, and a little haste or over-pressure may bring about commotions. But the risk must be run if civilization is to advance, and although the mutiny was the outcome of various blunders and miscalculations, it cleared the air like a great thunderstorm, so that the progress of India towards peace, good government, and stability under improved political institutions has since that time been remarkably rapid.

Col. Malleson gives us, in his final chapter, a panegyric upon the qualities of resolution, energy, and endurance displayed by the English in holding, against enormous numerical odds, their ground during a general insurrection in the northern provinces of India. He justly praises the clear-sighted audacity with which Sir John Lawrence and other leaders struck straight at the heart of the revolt when they determined that Delhi must be retaken at all hazards, concentrated their scanty forces upon that city, and staked everything upon the result of a desperate assault. He declares that in this hard-fought contest, as in many other similar predicaments, the English race "showed itself equal to difficulties which no other created race could have successfully encountered." This encomium is perhaps pitched a trifle too high for the occasion. The English have always been a stout-hearted people, with a large fund of tenacity and steadfastness in perilous situations; and during the first six months of the Indian mutiny, when their feeble garrisons were encompassed and nearly overwhelmed by rebels and mutineers, the highest characteristics of their race came out into fine prominence. But within that period the taking of Delhi and the relief of Lucknow had broken the back of the insurrection; for as soon as a large body of troops from England could be landed, all serious danger to the English Government disappeared, though there was prolonged resistance in certain parts of the country. India in 1891 is wonderfully different from India in 1857; the long peace and tranquillity have changed the habits of the people; there has been a great spread of education, an increase of wealth, industry, comfort, and of all the elements that make up a nation's civilization. No one now cares much to rake up the recollections of hatred and bloodshed which are associated with the transient but for the moment internecine struggle of 1857; yet some knowledge of the principal events and leading personages in that extraordinary drama is necessary to those who study the history of our time; and all such information can be readily found in Colonel Malleson's book.

Japanese Girls and Women. By Alice Mabel Bacon. Houghton, Mifflin & Co. 1891. Pp. 333.

A MORE charming and life-like picture of a hitherto undescribed portion of the world it would be difficult to find than Miss Bacon's account of Japanese women. The faithfulness of the picture it is also impossible to doubt. Miss Bacon has enjoyed the privilege of long and intimate friendship with a number of Japanese ladies and has been able to study their thoughts and daily lives in their own homes, besides having been a teacher in the Peeresses' School in Tokio. Her book has been carefully revised and criticised by a Japanese lady now in this country, and also by Mr. Griffis, the author of 'The Mikado's Empire.' Every page, moreover, bears internal evidence of careful and exact statement and of freedom from exaggeration. The reader can therefore give himself up to the enjoyment of the story of a strange and intensely interesting civilization without fear of being misled.

The more patent features of Japanese women's lives have been described before—the utter obedience which they are trained to show to their fathers, their husbands, and especially their mothers-in-law; their invariable grace and gentleness and their unquestioning submission to the rules of a formidable etiquette; and finally their extreme loyalty and courage when occasion demands those high qualities. But when all the details are filled in by a skilful hand, one gets the impression of a development very high of its kind, and one which a European civilization will do well to study closely before it destroys it. If the changes which Japan is undergoing in adopting a foreign civilization are very remarkable, those which the women of Japan are about to undergo are still more extraordinary. That they will before long obtain the same freedom and the same opportunities for education that their Western sisters now enjoy—and without having to endure so long a struggle to obtain them—there can be little doubt. It was an important moment for Japanese women when, "upon the 11th day of February, 1889, the day on which the Emperor, by his own act in giving a constitution to the people, limited his own power for the sake of putting his nation upon a level with the most civilized nations of the earth, he at the same time publicly placed his wife upon his own level. In an imperial progress made through the streets of Tokio, the Emperor and Empress, for the first time in the history of Japan, rode together in the imperial coach. . . . That this act on the part of the Emperor signifies the beginning of a new and better era, we cannot but hope."

There is, however, still much opposition on the part of prominent men in Japan to a change in the condition of women, short-lived as we may predict that it will be. Their excuse is that, while such power as the husband has over the wife might be abused, in fact it is not; that kind treatment, affection, and even respect for the wife are the general rule. Others oppose the new system of education for girls on the ground that it makes them unwomanly. The manners of the girls educated in the missionary schools are especially severely criticised as being extremely brusque and awkward. The author herself expresses the hope that means can be found by which the charm of manner which is the distinguishing feature of the Japanese woman may not be lost by contact with our Western shortness and roughness.

Interesting side-lights are thrown upon the servant question in Japan, and upon the disgust which the well-born Japanese feel for trade, and upon the artistic and literary pleasures which engross the time of Japanese men who have passed middle life—pleasures which the Japanese believe cannot be appreciated or even understood by the material Americans. But where every page is interesting, the reviewer has only to urge that every one should read the book for himself.

A Literary Manual of Foreign Quotations, Ancient and Modern. With illustrations from American and English authors, and explanatory notes. Compiled by John Devoe Belton. G. P. Putnam's Sons. 1891.

MR. BELTON'S title-page sufficiently indicates his scheme: he first translates more or less literally the foreign phrase, and then exemplifies its use by one or more citations from books, magazines, and newspapers. But he frequently cites French authors as well as English and American, in an English version, and in perhaps a score of instances he omits to mention

the writer quoted. Nor is he uniform in his mode of designating the source of a phrase: his rule is to append it directly, in parenthesis, but he sometimes gives it in the course of his explanatory note, and sometimes leaves it to be stated in the illustrative passage, when he doubtless does not hold himself responsible for the correctness of the attribution. There is, further, an inconsistency in the use of two sizes of type, the editor generally, but not always, appropriating the larger for himself. Typographical nicety, indeed, has not been carried far enough, though the proof-reading as a whole has been careful. The superfluous but defensible comma in *Ex pede, Herculem* is omitted in the succeeding *Ex ungue leonem*. On p. 39 and elsewhere Chateaubriand is given an accent on the first *a;* on p. 50 we find "Louis Phillipe"; on p. 166, "Abbé Migné," Crême, p. 34; suffit, p. 61; desirer, p. 77; dîne, p. 101, are other examples of carelessness, to which we may add the Greek words on p. 223 and "Sosie" on p. 101 (beside the correct form Sosia). On p. 57, the lines of Shakspere's sonnet are wrongly divided, with a sad effect upon the metre.

Mr. Belton draws freely for his illustrations on Thackeray, Scott, De Quincey, Chesterfield, Burke, Bacon, Matthew Arnold, Fielding, Macaulay, Montaigne, Heine, Byron, and many lesser lights. As the work grows he becomes oppressed by the material available, and he treats us to many condensed groups of familiar quotations (mostly unillustrated) derived from Horace, Ovid, Virgil, Goethe, La Rochefoucauld, from the French, etc. These are not inserted in their alphabetical order, but appear in one or other of the four indexes, Latin (much the largest), French, German, and Italian (the least ample). As groups, however, they cannot be discovered from the index.

In the main, Mr. Belton's translations are exact even if sometimes too literal and inelegant. "*The* earthly happiness" (*das irdische Glück*), p. 76, "*the* repentance is long" (*die Reu ist lang*), p. 113, involve an unidiomatic use of the definite article. *Beauté du diable* is explained to be the "transitory beauty of youth and freshness," but *transitory* does not enter into the notion. *Deus ex machina* is baldly translated "a god out of a machine," where "a god from the (stage) machinery" would have been better. To define *in petto* by "secretly" is to miss the implication of longing, as, "a President *in petto*," *i. e.*, a would-be President. The Horatian *Omne tulit punctum* is rendered "carries every point," instead of "wins all the suffrages." "Avenger" is not the proper word for *vindex* in *dignus vindice nodus*, but rather "deliverer" (Toussaint *Louverture*). The Romans fastened a wisp of hay to the horns of dangerous cattle (*fœnum in cornu*), not, we may be sure, "as a warning," but to prevent goring.

We would have refrained from these minute criticisms in the case of a poorer book. Mr. Belton has rendered a good service on a good plan and with much painstaking. We hope his manual may pass through many editions.

Recollections of President Lincoln and his Administration. By L. E. Chittenden, his Register of the Treasury. Harper & Bros. 8vo, pp. viii, 470.

Mr. Chittenden's book belongs to the valuable class of authentic memorials of a great historic time. He was an active Republican politician in Vermont in the State canvass of 1860, who, after the State election in September, stumped parts of Pennsylvania and New Jersey for Lincoln, under the direction of the National Committee. He was then appointed a member of the Peace Conference which met in Washington simultaneously with the meeting of the Confederate Provisional Government at Montgomery. He was secretary of the caucus of Republican members of the Conference, Mr. Chase being the chairman, and the relations thus established led to his being appointed Register of the Treasury when Mr. Chase became Secretary.

Mr. Lincoln admitted him to his friendship, and occasionally would take refuge in the Register's office as a "retreat" in which he could rest for an hour, undisturbed by the crowds of politicians and free from the incessant crush of visitors at the White House. The Register's responsible but routine duties were those with which the public had little to do, and one can well imagine that the humdrum quiet of his private office was like a land-locked haven to an ocean-tossed mariner, when the President slipped in for a while. He compared it to the "retreat" to which devout Catholics occasionally resort to rest and refresh the soul for another bout with the world, the flesh, and the devil. He was allowed to have there the absolute quiet, at least, of the monk's retreat, and Mr. Chittenden adopted the discreet policy of letting him talk or keep silence, as his mood might be, without assuming to play either the father-confessor or the over-attentive host. It is a picture full of human interest and sympathy, that of the weary man, sore burdened with the cares of state, finding thus in the inner room of one of the chief accountants of the Treasury the solitude he yearned for, the "society where none intrudes," though the "pathless woods" and the "sounding shore" were hopelessly beyond his reach.

The best proof, perhaps, of Mr. Chittenden's discretion is the fact that the material added to the biography of Mr. Lincoln, in these interviews, is not large. We get some things of great value, but the familiar footing on which the Register was put with the President gave the means at other times to learn much of Mr. Lincoln's heart and mind. We get both directly and incidentally new exhibitions of the clear insight which so often went at once to the heart of things, the lucid statement that was the end of argument; the absolute devotion to great purposes which made each separate resolution take its proper place as a clear-cut means to the end, the genial philosophy which never took thought of his dignity or demanded attention, the abounding charity and sympathy which made the unfortunate and the suffering feel of kin to him.

Some of the scenes which Mr. Chittenden has described are very telling. Such is the visit of the Peace Conference to the President-elect at Willard's Hotel. The unknown man, the uncertain quantity in national affairs, takes definite shape before friends and enemies who are equally curious and wistful, in the tremendous crisis, to learn what manner of man is to head the Administration. His homely ease, his entire possession of himself, his true and firm touch of important questions, the Socratic skill with which he turned or parried every embarrassing thrust, come fresh as a new revelation to us who have studied him to the end of his history. How must it have come to those who came to sneer, but stayed under a spell of hearty admiration?

There is another chapter which is also of capital importance in helping understand the man. It is the last in the book, in which is given the fullest utterance by Mr. Lincoln of his religious beliefs which has appeared in what purports to be his own language. Faith in a divine ruler of the universe had become a consoling refuge to the human ruler, conscious of the weakness of human means and methods in the convulsion of an unexampled civil war. The fact that serious minds on both sides in such a struggle could exercise faith in the same God, and hope for victory by a Providential overruling, is nothing strange. In proportion as they had greatness enough to understand the tremendous events in which they had a part, they would realize how infinitesimal their powers were, compared to the unseen forces at work upon nations. Napoleon's fatalism was only one mode of recognizing the infinite unseen. A more modest and more feeling man, like Lincoln, would be naturally led to the trust in a personal Providence which has been the consolation of ages; and as he has tried to find the right amid sore doubts, he cultivates, even with conscious effort, the faith that what thus seems to him right cannot be vanquished.

Mr. Chittenden makes a mistake in treating what Lincoln said to him as if it convicted other biographers of slander. The scepticism of careless youth, when a curiously active mind was wrestling with ignorance and half-truths as he physically wrestled with village bullies, is quite consistent with a saddened and ripened intellect seeking the comfort of reliance on superhuman help when he feels himself the sport of contending elements. The passage from that youth to that manhood is not incredible, however great may be the wonder and the pathos of it.

And so, in other parts of the book, the incidents and historical facts which Mr. Chittenden gives us of his own knowledge are full of interest, and are warmly welcomed, though his criticisms of others are as fallible as theirs would be of him. The phases of men and things which he has seen he has seen vividly and tells graphically, but they are phases and not the whole. The world will carefully sift and garner his new material, and will give full weight to his testimony; but it will still treat him as the witness to partial though important facts, and not as one authoritatively summing up the case.

Some of the most noteworthy of the chapters in the book have nothing to do with Lincoln. Such are the pictures of Gen. Scott and his conduct and influence during the last weeks of Buchanan's Administration; the counting of the Presidential vote and the action of Mr. Breckinridge as Vice-President; the description of the vast hospitals in the campaign of 1864, and the endless trains of ambulances bearing the wounded from the Potomac to Meridian Hill; the advance of Early upon the city, and the fighting at the Monocacy and afterwards around the Blair homestead at Silver Springs. In these and other well drawn scenes Mr. Chittenden has made a useful contribution to our knowledge of that time, and has set a good, though tardy, example to the veterans of both the civil and the military service who have postponed committing their memories to writing.

Letters and Correspondence of John Henry Newman during his life in the English Church, with a brief autobiography. Edited, at Cardinal Newman's request, by Anne Mozley. 2 vols. Longmans, Green & Co. 1890.

The nine hundred pages of these bulky volumes add but little to our knowledge of the public life of Newman and his passage from the Anglican to the Roman Church, but they

add a good deal to our knowledge of his private character, and it is of a sort that is very favorable to him. His was a remarkable family, and his correspondence with his mother and his sisters has at no time any touch of condescension, nor was there call for any. The tragedy of his "perversion" culminates in his letters to Mrs. John Mozley and her replies, and the correspondence is equally honorable to brother and sister. The mentions of F. W. Newman are few and brief, but kind so far as they go, which is not beyond the younger brother's Calvinistic stage. A brother Charles is only mentioned as in some sense the black sheep of the family. Had the book been autobiographical throughout, its interest would have been greatly enhanced, but it must have merely reproduced the 'Apologia.' The autobiography ends at 1832, when Hawkins, the Provost of Oriel, cut off Newman's pupils, and he went abroad with Hurrell Froude. The account of this is very full, as befits its importance in Newman's mind, for he says that but for this, humanly speaking, there would have been no Tractarian movement.

The autobiography is written in the third person, which relieves a little its intense self-consciousness. This, however, is everywhere in the book—in the letters and in Newman's comments upon them, written for the most part in his old age. It reaches its climax in the account of his fever in Sicily, the ghastly particulars of which are, along the course of several years, fished up from the gaps in his delirium. His would-be humility and must-be self-assertion and self-consciousness suggest Tennyson's St. Simeon Stylites. Nothing he ever thought or said or did fails of importance to his backward gaze. The charm of his epistolary style is much inferior to that of his sermons and other formal writings, which read as if they wrote themselves; but they did not, for see vol. ii., p. 223:

"I write, I write again: I write a third time in the course of six months. Then I take the third: I literally fill the paper with corrections, so that another person could not read it. I then write it out fair for the printer. I put it by; I take it up; I begin to correct again: it will not do. Alterations multiply, pages are rewritten, little lines sneak in and crawl about. The whole page is disfigured; I write again; I cannot count how many times this process is repeated."

The editor was chosen by Cardinal Newman, and part of her work was submitted to his criticism. There is certainly too much of it, as it has come to us, with a good deal that is not relevant to Newman's character or the Oxford movement. The lady's spirit is much better than her style, which sometimes leaves us in the dark as to her meaning. The best account of the famous Tract 90, of 1841, is by the late Dean Church in a letter to one of Newman's most valued friends. Newman's friendships are the most attractive feature of the book, after his relations to his mother and sisters. That with Keble was very beautiful, though not so perfect as that with J. W. Bowden. The strain of Newman's secession on Keble's Tory Anglicanism, which apparently never had one conscious Romeward inclination, any more than Pusey's (though the three walked *pari passu* up to Tract 90 and beyond), was naturally immense, and that he was equal to it proves how great his love for Newman was. The extravagance of Newman's over-estimate of Hurrell Froude, always a wonder, especially to those who have in mind the spiteful insolence and crudity of Froude's 'Remains,' is better understood in the light of his letters, which make up in personal kindliness for what they lack in large intelligence.

The commentary of these volumes on the 'Apologia' helps but little our understanding of the Tractarian movement. Certain things appear less pivotal here than there. Newman goes on after one thing and another, less conscious of definitive results than the 'Apologia' represents. We feel how slow he was to see that he was going to Rome, and how reluctantly he went. The concluding part of these volumes gives a much livelier sense than the 'Apologia' of his agony of heart and mind from 1843 to 1845, when he went over. They also give us a much livelier sense of the rancorous enmity of a certain Golightly, whom Newman had disappointed of the curacy at Littlemore. But for his stirring up of the Tract 90 business, Newman might have died an Anglican. The most painful aspects of the book are Newman's intellectual narrowness—his scholarship was little more than an unscholarly absorption in patristic literature—and the general lack of moral seriousness in his relations to the Tractarian movement. The everlasting talk is of conformity to the dogmatic and ritualistic standards of the early Church, almost as if there were no standards of ideal truth and righteousness. One reading only these volumes would get a very imperfect idea of Newman's spiritual depth and passion for holiness; and those who know him best will do well to refresh themselves after these arid sands at the fountain of his 'Parochial and Plain Sermons,' which are the best he has to give.

The Log of a Jack Tar; with O'Brien's Captivity in France. Edited by Commander V. Lovett Cameron, R.N. [Adventure Series.] London: T. Fisher Unwin; New York: Macmillan & Co.

THE first part of this volume is supposed to have been written by a sailor named James Choyce, and describes his adventures in different parts of the world between the years 1793 and 1822. Commander Cameron states in the preface that there can be no manner of doubt about the truth of the narrative, but he offers no evidence in proof of this assertion, and the confusion of dates and other indications warrant a certain amount of scepticism on the subject. For instance, on one of his whaling voyages Choyce describes an adventure with savages in the straits of Panther (Pantar?) on June 24, *1814*, and, after cruising for many months in the Pacific, he reaches England on Christmas Day, *1813*, after an absence of more than two years! Exact dates add much to the truthful appearance of any kind of story, and this guileless old man of the sea and his distinguished editor would have made a better case if they had been more careful in this respect. Setting aside the question of authenticity, the lover of adventures will find Choyce's story replete with curious and exciting incidents, but the man himself seems to have been an unmitigated rascal. He sacrificed his friends without compunction in order to carry out his plans, and did not hesitate to take service against his native country. The Spanish rulers of Peru and Chili, among whom he spent some years of captivity, were only too lenient to him and the other drunken ruffians who were captured with him, and the reader will find it difficult to take a sympathetic view of his misfortunes.

Capt. O'Brien, whose extraordinary escapes from French prisons in the years 1807 and 1808 are related in the second half of the volume, was a sailor of a very different stamp. Full of resource and of indomitable courage, he finally succeeded in escaping, with three of his fellow-prisoners, from the terrible subterranean prisons of Bitche; and his comrades owed their liberty entirely to his coolness and sagacity. His story, several editions of which were published after his return to England, bears every evidence of accuracy and veracity, and possesses an interest as thrilling as that of 'Monte Christo.' Before he was sent to the dungeons of Bitche he was imprisoned at Verdun, whence he made two efforts to escape, which ended in his recapture when almost within reach of liberty. So innumerable were the risks of travelling on foot through many miles of an enemy's country, well patrolled by gendarmes, that the reader is kept in suspense up to the very last page as to the result of the third venture. Thanks to the gallant Captain, this volume may be fairly considered as up to the standard of the series.

A Short History of Political Economy in England, from Adam Smith to Arnold Toynbee. By L. L. Price. [University Extension Series.] London: Methuen & Co. 1891.

MR. PRICE has made a very readable book, which is at the same time sufficiently critical and substantially accurate. Of course no one can expect to master the science of political economy by reading this sketch of 200 pages, but it is quite possible to get from it an idea of the general scope of economic thought during the past century. Mr. Price does not assume to offer critical estimates of his own, or obtrude his own opinions, although he is naturally somewhat affected by the socialistic tendency of the recent English writers. He inclines to the view that the lower grades of mankind can somehow be legislated upward, and he is not free from the current misconception of what is involved in free competition. Thus, he seems to agree with Toynbee in the statement concerning Adam Smith, that "he did not live to witness the distress which accompanied free competition in the early part of this century." How any one can consider that the industrial régime of that period was one of free competition passes comprehension. Such a view seems to ignore totally the immense work in the removal of restrictions that gives its glory to this century of English history.

This, however, is but a slight blemish, and in the main Mr. Price is conspicuously fair and just in his characterizations. There is a very judicious admixture of biographical detail, which not only gives some color to the statements of theory, but is also of value as showing the allowance that must be made for the personal equation in every development of science by human beings. In the case of Jevons perhaps Mr. Price does not sufficiently state his theory of value, which has had a good deal of influence upon later writers, notably upon Prof. Marshall. Such abstruse matters as this could of course not be adequately discussed within the limits here set, but the importance of the subject might have been indicated. But upon the whole, regarded as an introductory sketch, this book may be commended to the general reader as perhaps as good as anything that is attainable in small compass; nor is it undeserving of the attention of economists.

An Introduction to the Study of Botany. By Edward Aveling, D.S.C., Lond. With 271 illustrations and a glossary of over 600 words. London: Swan Sonnenschein & Co.; New York: Macmillan. 1891. Small 8vo, pp. iv., 363.

THIS book is designed to be of service to persons who intend to offer themselves for exami-

nation in botany at South Kensington and at the London University matriculation. After a short general introduction, some two hundred pages are devoted to the dissection and description of eighteen or twenty common plants, such as the buttercup, orpine, hyacinth, pea, primrose, dandelion, daisy, foxglove, hemlock, etc. Every part of the plant is minutely described, and many illustrations and diagrams accompany the text. For an elementary work this portion of the book is overloaded with technicalities. A buttercup may be entomophilous, dichogamous, and protandrous, and its monogynœcial fruit an etærio of achenes; but all this is surely too mysterious and repulsive for a beginner. The next ninety pages are devoted to structural botany, beginning with the vegetable cell, and so developing the subject to the fruit. We miss the well-known illustrations which so many text-books have borrowed from Sachs, and in place of them are figures whose only merit, in many instances, is originality. Throughout the book a Latin or Greek derivation is generally given to technical terms, and here, too, is originality. For instance, *Conium*, the name for hemlock, is said to be derived from κονία, *hemlock;* but this Greek word means *dust* or *ashes*, and κώνειον is hemlock. So also *regma*, an explosive fruit, should be derived from ῥῆγμα *a fracture*, and not from ῥέγμα, *something dyed or colored.*

The American publishers evidently hope that the treatise may be used in America, and, indeed, many of the plants selected for study are as common here as they are in England; but for American students the advice to purchase microscopes and microscopic supplies of a certain London dealer is somewhat inappropriate.

Studies in Statistics: Social, Political, and Medical. By George Blundell Longstaff. With maps and diagrams. London: Edward Stanford. 1891.

Mr. Longstaff has done his best to overcome by the elegance of this volume the usually arid and repellent aspect of statistical information. The superficial qualities of binding, paper, and type are of the highest order, while the more essential attributes of maps and diagrams leave nothing to be desired in their mechanical execution. But the volume has much more solid merits than such as appeal merely to the eye, and we note with pleasure that the author defines at the outset the necessary, although generally misunderstood, qualifications of the statistician. Acquaintance with mathematics and scientific methods of calculation is but a minor consideration.

"The primary requisite is a logical mind and a sound logical training; the second (and not less important) is a good general knowledge of the subject to which the figures under consideration relate. Only a chemist is likely to derive information from a new chemical experiment; in like manner the statistician must be now a banker, now a farmer, now a merchant, now a doctor, according as he is manipulating figures relating to currency, crops, tariffs, or causes of death."

We can do nothing more than call attention to a few of the points brought out by Mr. Longstaff. Perhaps that of most general importance relates to the correct determination of the comparative death-rate of a community. This is not to be found by dividing the number of inhabitants by the number of deaths. It is necessary also to ascertain the number of births, the amount of immigration and emigration, with particulars as to age and sex, and also to know the proportion of the sexes at the several ages. Thus, during the first year of life the excess of mortality of male infants is large; and again, after the thirty-fifth year females die less rapidly than males. Between the ages of ten and fifteen years the death-rate for both sexes is under four per thousand, while under one and over seventy-five it is considerably above one hundred and sixty. The composition of a population, therefore, must be carefully analyzed before we can precisely judge of its health. There is no question that the health of all growing cities is not so good as the figures generally given would indicate, and that most country districts are even more salubrious than is supposed.

The death-rate of England and Wales is now the lowest ever known, having dropped to 17.8 in 1888. This signifies that the mean duration of human life has increased several years over that given in the English Life Tables, and that the greater part of this increased life is lived during the most useful period, between the ages of twenty and sixty years. Some of this gain is due to the diminished virulence of zymotic diseases, the death-rate from fever having fallen since 1850 by nearly 60 per cent. Scarlet fever, diphtheria, diarrhœa, and phthisis are all considerably less fatal than formerly; cancer and diseases of the lungs, heart, brain, and kidneys are all more fatal. Diphtheria, it seems, is far more fatal in rural districts than in large towns; diarrhœa, on the other hand, being more fatal in the city than in the country.

As showing the utility of researches of this kind, we may mention the curves constructed by Mr. Longstaff for the purpose of making more apparent the relations of different diseases. That the curves of croup and diphtheria should be nearly parallel will occasion little surprise, although the evidence is of value as verifying existing theories. But a generalization of great importance may perhaps be derived from the striking similarity, amounting almost to identity, of the curves of erysipelas and puerperal fever. A connection is also suggested with scarletina, with pleurisy, with rheumatic fever, and with rheumatism of the heart. Mr. Longstaff's investigations are, of course, not of a character to suggest the nature of the causes affecting disease, but it is obvious that the medical profession may be greatly assisted in the work of determining these causes by such hints as these. We will only add that typhus fever seems in a fair way to become extinct.

The alarming extravagance of our Government is indicated by comparing the cost of the last English census, considerably under $1,000,000, with the amount provided for our census of last year, which was $6,400,000, exclusive of printing, engraving, binding, etc. No one knows what it will cost before we get through with it, while it is discredited in advance by the scandalous partisanship with which it has been conducted. Much interesting information concerning the movements of population has been extracted by Mr. Longstaff from the census reports, but it would have been well to delay the publication of these results until the reports of the current censuses were available. He finds that the immigration to England from Scotland and Ireland very nearly makes up for the emigration from England. In London there are every year some 135,000 births to 80,000 deaths, so that population increases naturally about 150 every day. The amount of emigration and immigration cannot be ascertained, but the natives of London are but 63 per cent. of its population.

The labor required to prepare such a volume as this is enormous, and Mr. Longstaff deserves the hearty thanks of all who desire to generalize concerning mankind from trustworthy data.

A Move for Better Roads: (Prize) Essays on Road-making and Maintenance, and Road Laws. With an Introduction by William H. Rhawn. Philadelphia: Henry Carey Baird & Co. 1891.

This book is one of the first results of that awakening on the question of common roads which is fortunately taking place in this country. The development of our wonderful system of railroads not only diverted private capital and public moneys, but the attention and interest of the nation, away from these important avenues of local communication. This neglect wrought its evils so gradually that generations of farmers have grown up accustomed to making the best of the difficulty without realizing the detriment to their interests occasioned by the rough and ill-made roads, and the long, steep hills over which they have always been compelled to haul their crops to market. Certainly it will be a surprise to thousands to read in the first prize essay in this excellent collection, that if a practically level road can be made around a hill where formerly the grade had been one foot in fifteen, by increasing the length of the road one mile, which would cost about $10,000, one hundred farmers obliged to use this road, and doing an ordinary amount of hauling, would, in saving of time and cost of maintenance of their teams alone, be benefited $6,750 a year, or $67.50 for each farmer, as a direct consequence of this improvement. It will also set many minds thinking to be told that it only requires a tractive force of 46 pounds to draw a long ton on a level Telford road, whereas on a level road made of gravel 147 pounds would be required, and on a common earth road the force needed increases to 200 pounds. It is estimated that the actual loss to the farmers in Pennsylvania from the deplorable condition of their roads over what it would cost them to do their haulage on first-class macadam roads, is $4,000,000 per annum. The total loss from this cause in the whole United States would form a startling figure.

It is evident that there is need enough for such a book as this. Incidentally it discusses the economic aspects of the problem, but the essayists waste little space in apologies. They proceed to the practical details of construction and maintenance, and it is doubtful whether such a thorough, exhaustive description of the proper methods for every kind of road-building has ever before been published. It is clearly, simply written, avoiding abstruse technicalities, so that whoever takes any interest in this move for better roads can without difficulty find instruction in its pages. What will, however, appeal to the intelligent general reader is the fact that road-making is not the simple affair it is usually thought to be; that it is, on the contrary, a problem of engineering, requiring wide knowledge and good judgment. This explains why so little good has resulted from the appropriations and from the labor expended in recent years under the direction of incompetent commissioners.

George Meredith: A Study. By Hannah Lynch. London: Methuen & Co. 1891.

This "study" is an expansion of a lecture given at Paris upon George Meredith. The writer was encouraged to do the work and enter a more public sphere by the fact that her "humble effort had sent at least three intel-

lectual foreigners to the fountain-head to study for themselves the novels of Mr. Meredith." Such converts enthusiasm can often make much more readily than criticism. The question of Mr. Meredith's genius may be put one side; but this little volume of damnatory reproach to the stupid fellow-countrymen of the novelist, and of triumphant chanting of the pæan over his victory, is as little deserving the name of a "study" in the critical sense as "Rule Brittania." We do not approve of a frequent use of the rhetorical schoolmaster's standard in judging of a book, but in this case we think it will serve. Here is a single sentence concerning which it is to be premised only that the gentlemen in it, the husband and the lover, have just been compared to "two respectable carriage-horses" harnessed with a "young war-steed" (the heroine), who is described as "perilously poised upon every incalculable impulse" and "scatterbrained upon all the ugly brinks in her career." The author goes on thus: "No wonder the unhappy Saxon gentlemen allied to this wild and too lovely Hibernian lost their heads and turned tail when it came to a choice of swallowing her whole and entire and following meekly in her wake, the obedient satellites," etc. We have only to add that the thoughts of this writer gallop very much after the pace of her metaphors.

BOOKS OF THE WEEK.

BEST ART
AT SMALLEST OUTLAY.

Signed artists' proofs of the best Etchings, costing with tasteful frame from $10 to $80. Frederick Keppel & Co. of Paris, and 20 East Sixteenth Street, New York, have just issued their illustrated Descriptive Catalogue (No. 8). It will be mailed on receipt of 10 cents in postage stamps. Also high-class Water Colors. Visitors are always welcome to call and examine these pictures.

Letters of Credit. We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and the West Indies; also make Collections and issue Commercial and Travellers' Credits, available in all parts of the world.

Brown Brothers & Co., Bankers,
NO. 59 WALL STREET, NEW YORK.

FOREIGN BOOKS SENT BY MAIL, postpaid, on receipt of advertised price.
A. LEMOIGNE, Libraire Commissionaire,
12 Rue Bonaparte, Paris.

JUST PUBLISHED.

The second volume in Appletons' Summer Series.

FROM SHADOW TO SUNLIGHT.

By the MARQUIS OF LORNE, author of "Love and Peril," "A Story of the Far Northwest," etc. 16mo. Half cloth, with specially designed cover, 50 cents.

CONSEQUENCES.

BY EGERTON CASTLE. No 74, Town and Country Library. 12mo. Cloth, $1.00; paper, 50 cents.

"It is a real pleasure to welcome a new novelist who shows both promise and performance. . . . The work is distinguished by *verve*, by close and wide observation of the ways and cities of many men, by touches of a reflection which is neither shallow nor charged with the trappings and suits of weightiness; and in many ways, not least in the striking end, it is decidedly original."—*Saturday Review.*

"Notable for a very powerful plot well worked out. The author writes clear, crisp, vigorous English. The descriptions of London life and of German student doings and duelings are piquant and realistic in the best sense."—*Academy.*

For sale by all booksellers; or will be sent by mail on receipt of price by the publishers,

D. APPLETON & CO.,
1, 3, AND 5 BOND ST., NEW YORK.

Coast of Maine.
CAPE ROSIER.

The lands of the "Cape Rosier Associates" on Penobscot Bay, 50 miles nearer Boston and the West than Bar Harbor, Mt. Desert, are offered for sale in parcels of five and ten acres and upwards. These lands comprise over ten miles of almost continuous shore-frontage in one of the boldest and most beautiful sections on the coast, twelve hours' journey from Boston. They front upon fine harbors, have beautiful rocky shores, beaches, woods, and mountain views. The drives along the shores and among the hills are very varied and beautiful. New wharves have been built, and new connections with daily trains and steamboats established. In these lands is offered an exceptional opportunity to purchase for very small sums fine and perfectly protected seashore estates. The lands will not be sold for speculation or in small lots.

ALFRED BOWDITCH,
HENRY PARKMAN,
J. MURRAY HOWE, } Trustees,
27 School Street, Boston, Mass.

AN ELEGANTLY BOUND SET OF the *Nation* for sale. Address Capt. Theo. FAUROT, Highland Falls, N. Y.

Exhaustion.

HORSFORD'S
ACID PHOSPHATE.

The phosphates of the system are consumed with every effort, and exhaustion usually indicates a lack of supply. The Acid Phosphate supplies the phosphates, thereby relieving exhaustion and increasing the capacity for labor. Pleasant to the taste.

Dr. A. N. KROUT, Van Wert, O., says: "Decidedly beneficial in nervous exhaustion."

Dr. S. T. NEWMAN, St. Louis, Mo, says: "A remedy of great service in many forms of exhaustion."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION: Be sure the word "Horsford's" is printed on the label. All others are spurious. Never sold in bulk.

A TREATISE ON MASSAGE.
By DOUGLAS GRAHAM, M.D.
New Edition. Octavo, 342 pages.
Mailed to any part of the world for $2.75 by
DAMRELL & UPHAM, Boston, Mass.

"This treatise is of the highest intrinsic value. Full of valuable and precise information, it never becomes dry or uninteresting. American humor sparkles in almost every page. A vein of strong common-sense runs throughout. The arrangement is excellent."—*The London Practitioner, March,* 1891.

SILVER, BURDETT & CO.,
PUBLISHERS,

The Nation.

NEW YORK, THURSDAY, JUNE 11, 1891.

The Week.

THE *Itata* affair has ended very happily in the voluntary surrender of her to the United States by the Congressional Junta which owned her, and one of whose ports she had reached. We may be allowed, now that the rumpus is over, to recall what we said on the 21st of May, when it had just begun, as to the proper way of getting possession of her and bringing her again within our jurisdiction:

> "Our remedy for the offence of the *Itata*, whatever it be, is at present to be sought from the Chilian Congressionalists by formal application. Whether she has committed an offence remains to be determined, for it is good law that American citizens may sell ships fit for war to foreign belligerents even, no matter where they take on their armaments. At all events, the fact and nature of her offence are to be settled by the courts, and not by the captain of the *Charleston*."

Such an application made to the Junta would undoubtedly have succeeded. But such a mode of proceeding had the demerit of being quiet and dignified and of having no "capital" in it. So we went to work in the way, so dear to Jingoes, known as "hullabaloo." We sent a steamer after the *Itata* three days after she had got away, and when there was not the smallest chance of catching her, and called it "a chase." Sometimes we said we were doing this in defence of our honor, and sometimes in discharge of our neutral duties to the usurper and traitor Balmaceda. And we went on for a full week, threatening and expecting to "blow her out of water" for committing a misdemeanor, and to fight the Chilian navy in order to get possession of her, and even to seize her in the ports of Mexico, to which she had not gone. A more undignified bit of swagger we have not had for a long time, but it is the kind of thing to which we are sure to be treated in every international complication whenever Mr. Blaine is at the helm. A telegram to Admiral McCann, in the Chilian waters, telling him what had happened, and directing him to ask the Congressional Junta for the surrender of the *Itata* when she arrived, would have settled the whole matter in a quiet, gentlemanly way, which should always be the way of a great nation.

Secretary Foster had a meeting with the New York bankers on Thursday, which has apparently had a cheering effect on all concerned. What has been troubling him and the country ever since he came into office, is the question what he should do about meeting the $57,000,000 4½ per cent. Government bonds falling due in September. The contention of his opponents ever since the Billion Congress adjourned has been, that the Treasury was so depleted that he would not be able to meet them without trenching on the reserve appropriated to the redemption of the greenbacks, or, in other words, without virtually confessing the insolvency of the Treasury. What he maintains is, that he has enough money to pay the bonds if absolutely necessary; that he has from $50,000,000 to $60,000,000 of cash available for the purpose; but in doing so he is forced to admit that it would be inconvenient and unpleasant to use it in this way, as it would draw his balance down very low. So he came on to New York to see whether the bankers would not advise him to do what, we presume, he had thought of doing all along, viz., ask the holders of the bonds, mostly Western banks, to let them run after maturity at 1½ per cent. interest. This, of course, would be, to all intents and purposes, the contraction of a new loan at a reduced rate of interest, and yet it is desirable that it should not look like a new loan, and thus enable the enemy to say that the Secretary had been obliged to borrow to meet the current demands on him. What he wanted of the bankers, therefore, was advice which would enable him to call it something else than a loan—such as an extension on mutually advantageous terms—and this they gave him. They pointed out that it was very important to the country that the banks which now hold the bonds should continue to hold them, in order not to have to contract their circulation just as the fall demand for money becomes most pressing; that it was also important that he should not offer them too low a rate of interest, because in that case the banks, finding they could make nothing on their circulation, would begin to sell their bonds at the risk of forcing them below par in the market—a very undesirable thing to have happen to a Government security. So that, in one way or another, it was made to seem the solemn duty of the Secretary to the country, with much resulting comfort to the Secretary himself, to put off on honorable terms the payment of the 4½ per cents. And he in his turn comforted the bankers by assuring them that under no circumstances would he fail in his duty to keep the silver money of the Government at par with gold, and that, no matter how much gold was exported, he would allow no slight to be inflicted on silver—that is, that he would do whatever was necessary to make it as good as gold in the form of currency.

There was a dinner given to Mr. Foster at the Union League Club in the evening, at which, according to the *Tribune's* brief report, an effort was made to improve the occasion for the benefit of the Republican party. Mr. Foster, according to this authority, there met the taunt contained in the epithet "billion-dollar Congress" by the argument that this is a "billion-dollar country," which really contains Mr. Evarts's celebrated defence of the tariff, "that even if $100,000,000 too much taxes are raised by the Government, what is this but $1.66 a head per annum, or three cents a week?" Mr. Foster maintained that although the appropriations made by the last Congress were "large," they were all "essential, and no larger than the needs of the country required." If this means that the money is sure to be spent, there is no denying it, but the fact that the money is "all gone" has never yet been accepted as proof that it was "essential" to the man who had the spending of it. It is no less true of governments than of individuals that their wants adapt themselves beautifully to their attainable incomes. If Congress were to vote two billions to-morrow, there would be no difficulty in finding "essentials" to lay it out on. We were, therefore, not surprised to hear from the Secretary, apropos of this, that "the Republican party had proved true in every emergency." No party certainly was ever more faithful in keeping up the supply of "essentials," or was ever livelier about the receipt of customs.

The Keystone Bank scandal in Philadelphia grows more portentous with each day's developments. It was shown on Thursday by the report of the experts who have been examining Bardsley's accounts as City Treasurer with the Keystone Bank, that he had about $200,000 more of the city's money in that bank than his books showed. He reported $441,000 as deposited, when he really had $628,000. As the authorized limit of city deposits in the bank was $400,000, Bardsley and his bondsmen were responsible for all above that sum, and to escape this responsibility he sought to conceal the excess by having it transferred to his personal account. The difference between the reported deposit and the actual deposit, amounting to nearly $200,000, was represented chiefly by his own unpaid checks, which he carried as cash. In order to raise the amount covered by these checks, when an investigation was ordered, he misappropriated $39,000 of city money lying in another national bank to the credit of city contractors. It also came out on Thursday that Bardsley has been a delinquent taxpayer since 1887, he being a large property-owner, and that, although he at present owes the city nearly $12,000 for taxes, his name has never appeared on the published list of the delinquent taxpayers. This revelation throws considerable light upon the fact, pointed out by the Philadelphia *Ledger*, that there were outstanding taxes at the beginning of the present year amounting to more than $6,000,000, of which $4,000,000 was uncollectible. Why were they uncollectible, and who was protecting Bardsley and other delinquents?

We were in hopes that the Postmaster-General would avail himself, in his address to his Bethany Sunday-school on Sunday, of

the recent sad occurrences in the banking world in Philadelphia in which he has played a prominent part. We were therefore much disappointed to find that, instead, he had talked to a large audience "of the righteous example of King Hezekiah." Now, the example of Hezekiah was righteous, but it nevertheless does not seem to us to furnish Mr. Wanamaker with a text suited to this occasion. Hezekiah's reign was prosperous, and he got the better of all his enemies, including Sennacherib, who was the most formidable; but it will be observed that when he "took all the silver that was found in the house of the Lord, and in the treasures of the King's house," and "cut off the gold from the doors of the temple of the Lord, and from the pillars which Hezekiah, King of Judah, had overlaid," he converted none of it to his own use. On the contrary, we are expressly told that he "gave it to the King of Assyria," on the public account, to save his country from devastation, having contracted to pay that monarch 300 talents of silver and 30 talents of gold as tribute. Moreover, Hezekiah, when threatened with death, was able to say, in his prayer for the prolongation of his life, "Remember now how I have walked before thee in truth and with a perfect heart, and have done that which is good in thy sight." He could not have said this if he had borrowed money, or levied taxes, or taken public treasure for unworthy purposes, or given it to men whom he knew to be dishonest, or spent it in ways which he dared not disclose, or got the keeper of the treasury to allow him secretly to overdraw his civil list, and then pretend to the people that he never took a shekel but what the law allowed.

The death of Sir John Macdonald is an event in Canadian politics of very great importance, and promises a period, probably short, of somewhat chaotic politics. It has for the moment produced something like consternation among the Tories and Imperialists, owing to his long tenure of power, the masterful way in which he has led them, and to the ingenious unscrupulousness with which he met all the troublesome questions with which Canadian politics bristles. His resemblance as a politician to our Mr. Blaine is most striking, and would doubtless have been complete had our system of government permitted Mr. Blaine to become both an executive officer and parliamentary leader. To study Mr. Blaine's career, keeping this limitation in mind, is almost to study Sir John's. Curiously enough, both of them, after having been extreme high-tariff men, became, about the same time, advocates of reciprocity on finding that protection was not fulfilling the promise of its prime. Both, too, owed a large part of their success to their "magnetism," and hearty, bluff manner, and readiness to be all things to all men. Sir John Macdonald's removal will necessitate a complete reconstruction of parties in Canada, and until this is done there is little use in speculating about its ulterior consequences. The one thing certain is, that his death is a serious blow to the British connection. Whether it will do anything for political purification is more than doubtful. No successfully corrupt politician has ever reigned long without leaving a school behind him trained in the same arts, and believing thoroughly, if not in their necessity, in their legitimacy.

The Secretary of Foreign Affairs for the Republic of Guatemala, Señor F. Anguiano, has made a long report on the Barrundia affair to the National Legislative Assembly. His account of Barrundia, personally, does not differ, except in giving more details, from that of Mr. Cabot Lodge in the House of Representatives last fall. He denies that Barrundia was an honorable political refugee. On the contrary, he says:

> "Gen. Don J. Martín Barrundia, who for several years had been Minister of War, departed from Guatemala in April, 1885, a few days after Gen. Don Manuel L. Barillas had entered upon the exercise of the Presidency of the Republic. His departure was not by virtue of any order of exile on the part of the Government, but was caused by the discovery of his having misappropriated a large amount of the national funds, and also by the criminal processes with which many individuals who had been victims of his misconduct, during the years that he had been Minister of War, threatened to arraign him before the courts of justice."

He further adds, and seems to prove, that when Barrundia was captured, he was not only a fugitive from criminal justice, but was actually engaged in a revolutionary attempt against the established government of Guatemala. Señor Anguiano then travels over the law of the matter, which is now familiar ground. His report will doubtless be a valuable document next winter, when the whole Mizner-Reiter-Barrundia transaction will be ripped open by the House of Representatives.

A discussion has been going on between the *Christian Union* and the *Examiner* over the question of the duty of a minister who finds himself seriously out of harmony with the views of his denomination. The former journal maintains that he ought to stay within his church and try to reform it, while the latter says that he is bound in honor to withdraw. In the loosely organized Congregational and Baptist churches it may, perhaps, be a question how stringent is a clergyman's obligation to keep within the limits of the general doctrinal belief of his denomination. But in the Presbyterian Church—and it is to that the whole discussion really refers—there can be no doubt about it, since all ministers have solemnly to subscribe to a definite creed. Nothing could be more demoralizing, therefore, than for a minister publicly and defiantly to declare, as a prominent Presbyterian pastor in this city recently did in his own church, that he "was not bound by the Westminster Confession." At the time of his installation he solemnly declared that he would be bound by it, and if he had not so declared, he could not have been installed. More than that—and this is a point which the religious papers just mentioned do not touch upon—such a man is receiving a salary from a church which has no legal right to its property unless it stands by the Confession. The financial question is one which will play a great part in the proposed withdrawal of Union Seminary from the oversight of the Assembly. From such oversight it can probably withdraw, but it cannot modify its statutes requiring assent to the Westminster without impairing the title to most of its property. And in the case of an individual minister, it would seem that the first thing a tender conscience ought to insist upon is the removal of all grounds for suspicion that monetary considerations have anything to do with his action. The moral grandeur of the Free Church disruption in Scotland was largely in its lofty indifference to the jingle of the guinea.

Few will read the letter of Mr. Philip Schuyler protesting against the proposed erection of a monument to his deceased aunt, Mrs. George L. Schuyler, by an obscure society, without asking whether an intrusion of this sort on privacy cannot be repressed by legal process. The point is certainly worth examination. It would be difficult to concoct a more ingenious or painful mode of annoying a family than starting a public subscription to erect a monument to a deceased relative whose life had been a strictly private one, thus bringing under public discussion his or her claims to this sort of remembrance. There is in a movement of this sort any amount of material for ridicule, or depreciation and even obloquy. It surely must be libellous under some authoritative definition of libel. It is, in the present case, aggravated by collocating the name of a strictly private person with that of a well-known public agitator, with whom, without meaning any disrespect to Miss Susan B. Anthony, Mrs. Schuyler would probably for no earthly inducement have appeared on a platform. It is somewhat like proposing to raise a subscription for a joint memorial to a very retired clergyman and Robert G. Ingersoll, on the ground of their common eminence as "thinkers." To get at the full enormity of the thing, we must suppose the possibility of a similar subscription being set on foot for purposes of ridicule and annoyance by the enemies of a living private individual. They might keep the subscription going for an indefinite period, without the smallest intention of ever building the monument. Surely the law has some remedy for this species of misery.

We presume most readers of the *Tribune* who read Sunday papers at all, opened last Sunday's edition of that journal with the expectation of finding therein the fullest account yet given of the ins and outs of the Cumming trial, from the pen of our old friend the Tory Squire. There is no subject on which, as a rule, the Squire is better fitted to shine, or shines more, than a trouble of some kind

among "smart people." He speaks on all this class of topics with the authority and with the air of a master, for is he not one of the "smart people" himself? He has only to interrogate himself to know how they feel, even at important crises in their lives. Moreover, there has not been, since he made his appearance in the highest circles of London society, an occasion more worthy of his powers, or one of more absorbing interest to the British public, than this one. The scenes in court, the appearance and dress of the ladies, the fence of the opposing counsel, the appearance and behavior of the Prince of Wales in the witness-box (not "stand"), and the appalling audacity of the juryman who cross-examined his Royal Highness, formed a combination of attractions which the ordinary ill-informed reader expected to call into exercise the Squire's very highest talent as a fashionable chronicler. We say, "the ill-informed reader." Those, however, who, like ourselves, know the Squire's place in the exalted sphere in which he lives, did not expect him to come out with anything like his normal splendor and effusiveness about this trial on Sunday, and they were not disappointed. He had three columns in the *Tribune*, of which he devoted two and a half to the Bering Sea question, Sir John Macdonald, the peace of Europe, the Queen's views on the Irish church, Balfour, Parnell, the omnibus men, copyright, and Dr. Fordyce Barker's death, but only at the end, in a couple of small paragraphs, did he make any mention of the baccarat case, and a very colorless mention it was. Some people may be disgusted with this reticence, but we are not. We say it evinces a delicacy and refinement not often found among journalists. The truth is, that the Squire's relations with an exalted personage to whom he distantly alludes as "one of the most distinguished personages concerned," forbid his going into this very disagreeable matter with common newspaper freedom. A county gentleman necessarily has his limitations as a newspaper correspondent. There are certain things on which his position forbids him to dilate, no matter how eagerly a sensation-loving public may desire to hear from him. They must console themselves by remembering that the very things which seal the Squire's lips to-day, constitute his greatness as a social authority on ordinary occasions.

An interesting contribution to the discussion of profit-sharing was made by Mr. A. H. D. Acland, M.P., in his recent address as Chairman at the opening of the Twenty-third annual congress of the Coöperative Societies of Great Britain. These societies conduct stores, both wholesale and retail, which do a great and steadily increasing business, and which return large profits to those who find the capital. But those employed in such stores are no better off than employees in other stores; indeed, it was admitted at this meeting that "there had been a tendency on the part of Coöperative Societies to give contracts to the lowest tender and the jerry builder," and an appeal was made that they should pay at least "the current rates of wages." As for the theory that, in the industries of the country generally, profit-sharing would be found the solution of labor difficulties, and that thus the interests of masters and men would become identified, Mr. Acland remarked: "It could not be said that either abroad—though there were a few remarkable instances on the Continent—or at home those hopes had been widely realized. Even at the best, it was a very difficult system to work, and was almost inapplicable in many trades. The ideal coöperative productive society, where all the capital was owned by workers, was admitted to be an impossibility, except in the rarest cases."

Mr. Balfour's announcement that he is about to issue a proclamation suspending the operation of the Coercion Act throughout Ireland is probably part of the general process of taking in sail in preparation for the general election, in which the Ministry is now engaged. It is doubtless true that there is much less disturbance in Ireland than there has been, but only a small part, if any, of the improvement is due to the operation of the law. The Plan of Campaign, which the Act was mainly intended to meet, diminished owing to its success on the principal estates on which it was tried. What was left of it after this, has expired through the lack of funds caused by the Parnellite split in the Irish ranks. The claim that the Coercion Act killed it is baseless. It kept going vigorously during five years of most relentless execution of the law, which included, in the beginning, a plank bed and prison fare and clothing for the orators who supported it. What has done most, probably, to bring about the suspension is the failure of those hopes, based on the division in the Irish ranks, to which Lord Salisbury gave expression when he advised his followers "to put their money on Parnell." As all those who have done so are apparently out of pocket, something new has to be tried on the now dear, but once contemptible, Irish, particularly as the free-education sop offered to the English electors appears to be a total failure.

The adoption of the new Constitution in Brazil has been shorn of its present effectiveness by the failure of the Constituent Congress, before adjournment, to pass laws putting it into execution. Thus the new instrument provides for the complete separation of Church and State, yet the Administration has just refused to admit that ecclesiastical property is subject to the common law. It takes the position that the pre-existing body of laws was not annulled, *ipso facto*, by the adoption of the Constitution, and that, until they are specifically repealed and others enacted in their places, they must remain in force. The popular opinion was wholly to the contrary, and it is a matter of much public complaint and indignation that the Executive is not putting the Constitution in force. In like manner, the municipal government of Rio is in a singular condition of legal uncertainty. It derived all its power from the Provisional Government, which is now extinct, and has never been recognized by the Constitutional Government. It is also maintained that the very members of the Cabinet are illegally in office, since they were put in office, most of them, before the adoption of the Constitution, and have not been subsequently confirmed. Whatever may be said of the Government's contention that the Constitution does not execute itself without supplementary laws, it certainly seems absurd for it to say that old laws directly opposed to the Constitution are in force until repealed. If unconstitutional, they are as if they never were. At any rate, the unsatisfactoriness of the whole situation is sure to make the Government trouble when the next Congress meets.

The financial troubles in which Portugal is now plunged have been long accumulating. Partly owing to financial incapacity on the part of the Government, partly to the fear of revolution always before the eyes of any Minister of Finance who should propose increased taxation to meet increased expenses, the country's debt has gone on heaping up, under the policy of constant borrowing, until now the national credit is almost exhausted. The total indebtedness has risen from about $400,000,000 in 1875 to nearly $700,000,000 at present—or an advance from a debt of $87 per capita to $135. For this there is little to show, except the 505 miles of Government railways, and the 780 miles privately owned but liberally subsidized out of the public funds. The revenue has been steadily below outlay, and for a considerable time fully one-half of the total income has been required to pay interest charges. The budget for the current year shows an estimated deficit of upwards of $2,000,000, and the shortage will, of course, turn out to be larger than that sum. Where the Government can borrow, except at ruinous rates, does not appear. The attempt to float a loan in London last year was a flat failure. About $15,000,000 were obtained last December from a syndicate of Paris bankers, for 3 per cent. bonds taken at 46, secured by a lien on the Government tobacco revenue. This is only a temporary loan, however, and the Minister of Finance got the Cortes last March to vote the Government a monopoly of the tobacco manufacture, and to authorize a loan of $50,000,000 on the strength of it. But just about then came the dispute with England over South African boundaries, and killed the negotiations for a loan in London. The crisis became so severe that a decree was issued May 11 suspending payments for 60 days to save the banks. Late telegrams show that the Paris lenders are advancing more money, but the situation is such that only radical measures can relieve it, and no Ministry is strong enough to take radical measures.

MR. WANAMAKER'S CONFESSIONS.

MR. WANAMAKER appeared before the Keystone Bank Investigating Committee on Monday, with a written statement, prepared under the advice of legal counsel, in which he professed to give a complete account of all his relations to the bank and its wreckers. In order to comprehend the full meaning of his statement it is necessary to recall what had been revealed by previous witnesses bearing upon those same relations. It had been shown that Mr. Wanamaker was on very friendly terms with Lucas, the dead President of the bank, who stole $998,000 of its funds, and with Marsh, the fugitive President, who succeeded Lucas and concealed his predecessor's theft by means of false statements and other deceits; that he enjoyed most unusual favors at the bank during Marsh's Presidency; that Marsh once lent him $200,000 of the bank's money on his personal note, without the knowledge of the directors; that although the National Banking Law forbade the granting of discounts beyond $50,000 in amount, Mr. Wanamaker was able to get discounts to the extent of $150,000 based upon his own notes without collateral, and that Mrs. Wanamaker was allowed to overdraw her personal account in the bank to the extent of $1,000, and possibly $5,000.

On every one of these counts Mr. Wanamaker confesses judgment, and on the most serious of them he supplies new evidence. In regard to his relations with the dead President Lucas, he confesses not merely that they were friendly, but that the two men entered together upon a speculative venture in Reading stock in which the Keystone Bank's money was used with great freedom. They purchased Reading stock on joint account, Lucas supplying certain sums of money as Wanamaker called for them and depositing the same to Wanamaker's personal account in the Keystone Bank, and on this Wanamaker drew checks amounting to $60,000. Upon several occasions when Wanamaker called for money, Lucas gave him Keystone Bank stock, and when Lucas died, Wanamaker held 2,515 shares of this stock, which he had used for raising money in various ways. After Lucas's death, Wanamaker discovered, he says, that no money had been placed to his credit, and that his account at the bank was overdrawn to the extent of about $60,000. He thereupon held fast to the 2,515 shares of Keystone stock as security for that loss. The character of this stock and its subsequent career in Mr. Wanamaker's hands we shall describe later.

The other counts of the case against Mr. Wanamaker were that he had enjoyed unusual favors at the Keystone Bank during Marsh's Presidency, had been granted discounts to an extent three times as great as allowed by law, and that Mrs. Wanamaker had been permitted to overdraw her account. He admits the truth of all of them. The statement of a $200,000 loan by Marsh without security was made by a director of the bank, and Mr. Wanamaker admits it by making no reference to it. The statement as to illegal discounts was made by the Bank Examiner, Mr. Drew. Mr. Wanamaker admits one discount for February, 1890, of $50,000, the full legal limit, and another one of $50,000 in the same month, explaining that the second one "was understood to be personal to me individually." Another discount of $60,000 was granted at Marsh's personal request because he wanted Wanamaker paper for use in country banks and otherwise. As for Mrs. Wanamaker's account, that was kept for convenience under a separate head, but it was really a part of the firm's account, and could not be overdrawn while the latter had a balance to its credit.

On minor points, about which there have been only suspicions, Mr. Wanamaker's statement and his admissions on cross-examination do little to clear up the mystery, and serve in many ways to add to it. He shows that his firm had deposits of nearly $400,000 in the Keystone Bank in November, and that though they were kept there during the "runs" on the bank, they were gradually removed, so that when the collapse came there was little or nothing left to be lost. He denies solemnly that he was ever a stockholder of the bank, yet he held 2,515 shares of its stock for several years, and used it as a basis for loans. He denies that he had any opportunity which smaller depositors did not have of knowing the condition of the bank in time to get his deposits out, that he knew anything about the Lucas defalcation till after the run in December, and yet he admits that Marsh told him in August last that the bank could not afford to continue to pay 6 per cent. interest on the Penny Saving Fund of the Bethany Church, and that although they had been able to get only 2 per cent. interest on that fund up to the time when Marsh as a personal favor had taken it into the Keystone Bank at 6 per cent., yet as soon as Marsh said they could not continue to pay it he took out the entire fund. It has not yet been shown that other depositors got so valuable a hint as this at so early a day.

It has been said, not shown in the testimony, that Mr. Wanamaker had personal knowledge of Bardsley's doubtful character at the time he was nominated for City Treasurer, and that he raised a fund of about $75,000 to be used in paying Bardsley's debts, but never paid it over because the debts were discovered to be twice that amount. Mr. Wanamaker's answer on this point is extremely interesting: "I never had a business transaction with Mr. Bardsley individually, or as City Treasurer, or with any one representing him in either capacity. I never subscribed any money for his benefit at any time." This is elaborate denial of something that has never been charged. Nobody ever suspected that Mr. Wanamaker himself subscribed anything to this Bardsley fund any more than he did to his celebrated Quay-Harrison fund. He was acting as collector in both cases.

To return for a moment to the 2,515 shares of Keystone Bank stock. Marsh, the fugitive President, says that it is fraudulent or over-issue stock, and is worthless. Mr. Wanamaker admits in his cross-examination that when he discovered that Lucas had not put in the $60,000 in money to meet his (Wanamaker's) checks to that amount—*checks which the bank had cashed*—he held the bank stock as security for the loss; that when Marsh and Mr. Lucas asked him to give it up he refused to do so until his loss was made good; that when he was told that it was fraudulent stock he refused to believe it, and made repeated efforts to sell it, even after the bank had failed, asking at first $100,000 and then offering to sell it at $50,000; that finally he surrendered it to the Lucas estate, and thus considered his relations with Lucas closed without loss on either side, and that he still refuses to believe that the stock is fraudulent.

We have here a simple, unbroken narrative of intimate personal and financial association between Lucas and Wanamaker and Marsh and Wanamaker from the time the former began to speculate with the bank's funds down to the time when the bank collapsed. Lucas went into a "blind pool" with Wanamaker in Reading stock, and when he got into difficulties issued fraudulent Keystone stock upon which Wanamaker raised funds. Marsh, as Lucas's successor, and falsifier of the bank's accounts to hide Lucas's theft, gave Wanamaker most unusual privileges at the bank. When the bank could be kept going no longer, Wanamaker got his money and his firm's money and the Bethany fund money out. Then the collapse came, and it was discovered that while poor depositors had lost considerable sums, the chief losers had been the city of Philadelphia, $600,000 of whose deposits had gone, and the State of Pennsylvania, $930,000 of whose deposits had gone also. Mr. Wanamaker takes the witness stand, rolls up his eyes, says he is glad to be permitted to be there, makes his confession, and says if there has been any wrong done he knows nothing about it, and that if Lucas and Marsh and Bardsley and Drew were bad men they kept their badness entirely away from his pious eyes. And the whole newspaper press of Philadelphia—so mighty is the power of Wanamaker "ads."—comes out solemnly the day after the exhibition and declares that his confession is a complete and conclusive vindication.

REPUBLICAN DECADENCE AT THE COLLEGES.

FOR some twenty years, beginning with 1870, the classes of the Academic Department of Yale University just before graduation have had printed a volume of class statistics known now as the "class-book." It gives, along with many statistics which are trifling or facetious, others that have substance and value. Among the latter are those showing the strength of the political parties in the class during the last term of the Senior year. In the class of 1891 those figures have just been published, giving

80 Republicans, 32 Democrats, 11 "Mugwumps," and 4 Prohibitionists—showing that 47 out of 127 who gave in their party preference, or about 37 per cent., no longer act with the Republican party. It will be noticed that this year the Democrats number almost one-half as many as the Republicans, while in no Senior Class at Yale up to 1886 had they numbered so many as one-third. But in order to make the comparison as broad as possible, it is better to ignore in the main any particular class and take the statistics for the twenty classes since and including 1870, the classes of 1871 and 1872 having had no class-book printed. The showing will thus be expanded so as to cover twenty years of time and some two thousand students, many of them legal voters.

As an initial comparison, we simply take those who have recorded themselves as Democrats or Republicans—a division which nearly eliminates those who count themselves as "Independents," "Mugwumps," and Prohibitionists, as well as a certain number who are mere doubters, or who, "for fun," may have recorded themselves outside of the Republican or Democratic list. Dividing the twenty classes into two groups, the ten classes previous to 1882 give us 788 Republicans and 161 Democrats. For the ten years since 1881 the computation gives us 744 Republicans and 249 Democrats. The Senior year academic "vote" during the last ten years thus shows a loss of 44 in the case of the Republicans, a gain of 88 for the Democrats. In other words, the Republicans have lost say 5.6 per cent., while the Democrats have gained about 54.7 per cent. This change has taken place, too, in the face of the fact that the young men at college are at first apt to adopt "paternal" politics, whether they are "new voters" or non-voters.

In the case of some of the later classes the change is most strikingly marked. Thus in the class of 1889, who must have measurably formed their political opinions during the tariff Presidential campaign of 1888, there are recorded forty-three Republicans, thirty-one Democrats, twenty "Mugwumps," and three Prohibitionists. Of the members of that class who actually voted in 1888 there were twenty who voted for Harrison, eighteen for Cleveland, and two for Fisk. In the class of 1890 there were twenty voters in 1888, of whom twelve voted for Harrison, seven for Cleveland, and one for Fisk. Again, taking the last three classes, we find they have counted 211 Republicans, 107 Democrats, 44 "Mugwumps" and Independents, and 7 Prohibitionists. In these three classes, whose party opinions have been formed on recent political questions, the Democrats number more than one-half the Republicans, while in the ten years before 1882 they were only about one-fifth; and the Democrats, "Independents," and "Mugwumps" together have had, in the three classes, say three votes to four of the Republicans.

While college statistics of this kind cannot be exact, yet errors largely offset each other, and the steady drift of the older undergraduates from the Republican party is clearly demonstrated. The figures have also further meanings. In 1870, when the class statistics first began at Yale, there were only 518 undergraduates in the academic department; in 1891 there are 832. Yet, in spite of this increase, which has been pretty steady during the interval, the Republican "vote" of Senior year shows an absolute loss for the last ten years, as compared with the years preceding since 1870, while the Democratic gain of 54.7 per cent is very far from equalizing the whole "vote" to the ratio of gain in the whole number of academic students. Or, to state the case in figures, while the total Democratic and Republican "vote" in the ten Senior Classes for the first ten years cited was 949, it was for the second ten years 993, showing an increase of but 44, or about 4.6 per cent. The figures of membership for the graduating classes during the same two periods were respectively 1,191 and 1,401, or a gain of about 17.6 per cent. Thus the Democratic and Republican "vote" combined has not kept pace with the increase of numbers in the graduating classes, and the difference must be made up in part at least of those who refuse to go into the class statistics as members of either of the two leading parties. How weakly the Republican party is represented nowadays in this non-party element we all are aware, and if it could be worked into the figures, they would make the evidence of Republican decadence as proved by the Yale class statistics much more impressive. Probably they would show that the Republicans have hardly at present any majority at all, as was the case, we believe, when the general canvass at Harvard University was made during the Presidential campaign of 1888.

Take that Harvard canvass and join it with the figures we have given at Yale, and the testimony is certainly most telling as to the rapid decline of the old "party of moral ideas" among the young men at our two leading universities, where the opponents of the party twenty years ago did not number probably 10 per cent. of the two student constituencies. Add the palpable change of sentiment among the members of the two University faculties, as well as the wholesale secessions among the "thinking voters" who are graduates, and we get further evidence fit for the Republican party to view with the most prayerful solicitude. It was not long ago that Mr. Clarkson, the Lord High Executioner of fourth-class postmasters, spoke his lament over the entrance of Democratic literature into Republican homes. If he will turn his eye on our colleges, he will find a kindred theme for a fresh and more sorrowful Jeremiad.

"TACT" IN THEOLOGY.

If Pascal were alive, he would find material for a new series of "Provincial Letters" in the phases of our latest theological controversies. Conveniently ambiguous words, like his *pouvoir prochain*, made at one time the test of orthodoxy, at another a cover for heretical opinions, would meet him at every turn. And the elusive and conflicting views of our modern Sorbonne, better able, like its seventeenth-century prototype, to "find monks than reasons," would call for the full exercise of the detective qualities of his analytic intellect. One phrase in particular would, we are sure, call forth a delightful letter. We refer to the current saying that a man needs "tact" in holding and uttering questionable theological opinions. If Prof. Briggs had only had "tact," so has groaned more than one of his friends, if he had not been so blunt and pugnacious, he might have held his horrifying doctrines, and fifty others worse, and no one would have troubled him. And then they have mentioned this and the other leader of the Church, living or dead, either one of whom, they assert, would have had enough of this most desirable "tact" to run the rapids in perfect safety.

Now, it is to be remarked that this quality is a newly discovered requisite in a religious leader. Doubtless the venerated reformers of other days would have got on much better if they had known about it. With a due amount of this "tact," Calvin would not have had to flee from Paris for his life on account of his radical utterances. And everybody knows how deplorably wanting in it Luther was—the reckless, world-defying Teuton. And even the one whom both Luther and Calvin called Master was terribly indiscreet, rashly denounced the current theology of his day as a mass of unreasonable tradition, and acted so that his alarmed friends thought he was "beside himself." Still, changed times may justify the honor paid to this new characteristic, and it is only fair to ask what it really is, and what it has accomplished in these days of its prevalence.

It turns out, however, that this lauded quality of the modern theologian is shown by examination to be only the thing which already had the appropriate name of trimming. What is really meant by this necessary "tact" is holding one opinion in private and another in public, saying one thing to young men in a seminary and quite another to the General Assembly, and deftly alternating between the courage and cowardice of one's convictions. Moreover, the conspicuous examples of "tact" to which reference is made, are men who really lost the best influence of their lives by being trimmers. They won great standing and had honors heaped high upon them, of course; that is what trimming is for. But they never resolutely grappled with questions on which men were dividing. At crises they flinched or dodged. Like Orville Dewey in the civil war, they could not "take a part." And thus their example simply amounts to this, that the safe way to hold heretical views is to hold them in secret. If it is a question of transmuting opinion into life and influence, these men are cited with irrelevance.

The truth is, this praise of "tact" in theology is a part of the spirit of luxury which has invaded the Church just as it has the rest of society. The churches have had their eyes fixed on outward prosperity. They have had vast sums to dispose of in pushing their denominational propaganda. They have been racing with each other for

the control of the expanding West. Reports of churches organized and buildings erected and missionaries sent out and converts gained and legacies received have been the main thing of interest in ecclesiastical gatherings. Over and over again have prominent men in the churches risen to denounce doctrinal agitation, on the express ground that it interfered with the great "practical work" of the age. That is to say, nothing in the nature of inquiry after the truth must be allowed to disturb us. Here we want to build a cathedral, there endow a college, yonder erect a great denominational building, and we cannot stop to listen to theories.

Fortunately, men's minds cannot be for ever repressed in that way. Investigation is the most "practical" thing in the world, and truth the most useful. And so, when the proper time comes, a church or a society that has long been saying to itself, "Thou hast much goods laid up for many years, eat, drink, and—act with 'tact,'" finds that it has been living in a fool's paradise. One right prophetic voice is enough to dispel the temporary delusion, and recall men to that pursuit of the truth which is at once their noblest and most unavoidable function.

"THE PRINCE OF WALES'S SET."

THE attack made by Sir Edward Clarke, the Solicitor-General, on Monday in court on the Prince of Wales is something unprecedented in either legal or political annals in England. It will be interesting to see whether Lord Salisbury will keep him in office after so bold a departure from established forensic usage. If Sir Edward should suffer in this way for his temerity, it will illustrate anew the inconvenience of having the law officers of the Crown retain their private practice, but it will also probably make him a hero and a martyr in the eyes of the Radicals. The risk he is running is certainly very great, for no English barrister's ambition is limited to the acquisition of a large practice. Success at the English bar is not success in the highest sense of the word unless it is marked by official promotion, through the Solicitor-Generalship and the Attorney-Generalship, to the Lord Chancellorship or other high judicial office—such as the Lord Chief Justiceship or one of the Lord Justiceships of Appeal. This promotion is, of course, in the gift of the Ministry of the day. Whatever the future may have in store in the way of ministerial indifference to royal susceptibilities, no Minister of either party has hitherto shown himself ready to disregard absolutely the personal objection of the Crown to a particular appointment. So that Sir Edward has literally taken his professional life in his hands in making the *retour offensif* directed against the Prince and his friends the Wilsons, with which he enlivened the proceedings on Monday.

That there was great danger of some such social earthquake has long been plain to everybody who has watched the Prince's career ever since he was first brought into court twenty years ago in the Mordaunt divorce case. It was then clear enough that the materials of great scandal were rapidly accumulating about him, and that he would, unless he wholly changed his ways, become more and more dependent on the discretion of his friends to escape some damaging explosion as the years went on. But he could not change his ways. Neither his education, nor his mental powers, nor his place in the British hierarchy offered him assistance in abandoning the life of "a man of pleasure" which the English political and social conditions imposed on him almost as soon as he reached his majority. In fact, the hereditary monarchy in England at present provides no serious pursuit for the heir to the throne. The example set by his father, even when very young, of trying to teach English statesmen how to govern England, he could not follow, even if he had had his father's mental equipment. It would, in his father's case, have excited deep popular resentment had it been publicly known even between 1850 and 1860. Between 1880 and 1890 it would have been out of the question. The course of English politics during the last thirty years would have made the Prince of Wales's rôle purely ceremonial, even if the usages of constitutional monarchy and the Queen's continued health and activity did not do it.

A life of amusement, surrounded by idle men and women, was what circumstances marked out for him, and unfortunately his tastes fell in with his necessity. More unfortunately still, he became the most prominent figure in English society just as it was beginning to feel the effect of the great economic changes of the last thirty years. He has found himself beset, ever since his first youth, by a growing body of people like his friends the Wilsons, newly enriched in trade or commerce, and eager to get into court society, and to pay for it in cash or its equivalent in good living and good shooting and comfortable country quarters. These people have for years been making a dead set on him and his aristocratic companions, and they have for the last ten years captured them with increasing facility, owing to the impoverishment of the old landed gentry. It is the Wilson genus who now offer the best table, the best wines, the best preserves and deer forests, and can stand the heaviest losses at the card-table, and the Prince has fallen a victim to their fascinations. Given his easy temper, great love of good living and fun, and the conquest was easy.

The results have been pitiful. The conservative portion of the English public, and especially the Nonconformists, have long been pained by the rumors which have been afloat about the Prince's ways of passing his leisure hours, and about the kind of people he helps "to get into society," but they have gone on hoping for better things. This hopefulness about him, even when he has passed into the fifties, probably nobody but a "loyal Englishman" can understand fully. But no proper judgment can be passed on their connivance in or condonation of his weakness without remembering that, even if the belief in the divine right of kings be dead in England, the association of the monarch, and of his family, with eight hundred years of liberty and glory, is still strong in the English imagination. The blood of Alfred the Great runs in the Prince's veins, and some one of his kith and kin has sat on the throne not only ever since England became great, but ever since it became England. The sternest English Republican is moved, and not ignobly moved, by considerations of this sort, and no right-minded man can help feeling some sympathy with those who are pained and shamed by finding that the heir to all these great memories goes about from one rich man's house to another, carrying with him a gambling "lay-out," and urging his hosts and their friends to play for high stakes games of chance which are forbidden by law even at the clubs and hotels. To be sure, they know that Satan finds some mischief still for idle hands to do, but they fervently wish he would make an exception in favor of the heir to the English throne.

The Wilsons, on whom Sir Edward Clarke has turned so savagely, are really no more to blame than probably fifty other families of similar antecedents whom the Prince has honored with his visits. In fact, they are probably less to blame, for theirs is very likely the only house in which the Prince has broken through the host's rule against baccarat. Moreover, if current reports have even slight foundation, very few baccarat parties at English country houses fail to contain at least one member on whom some suspicion of cheating occasionally rests. The temptation to the poor young men and the wicked old women who help to make them up, must every now and then be overwhelming. The mistake of the Wilsons was in allowing themselves to be thrown into a state of wild excitement by the chance of catching a Colonel in the Guards *en flagrant délit*. The occasion was for them a great one, and they either lost their heads over it, or else, as Sir Edward Clarke insinuates, had taken too much champagne at "a long dinner" at which they celebrated the victory of the Prince's horse at the Doncaster races.

If they had been older, or longer in the "Prince's set," they would have insisted on stopping the play the minute suspicion was uttered, and have got the whole party out of the house with as little noise as possible. Their procrastination, and especially their watching their own guest, of which they now seem ashamed, but which seems proved, furnished a terrible weapon to Cumming when he determined to sell his life dearly. One other weapon, hardly less effective, has been put into his hands by the written promise of secrecy. Two of the signers, the Prince and Gen. Owen Williams, are in the army as well as Cumming. When, therefore, Sir Charles Russell warned the jury that, even if they gave Cumming a verdict, the military authorities would be compelled to take the matter up, and perhaps strike his name from the army list, his counsel retorted with terrible force that the Prince and Gen. Williams would

in that case be in the same boat with him, because, in the eye of a court-martial, concealing the fact that a brother officer has been charged with dishonorable conduct makes a man *particeps criminis*. On the whole, the case furnishes one of the most interesting social and political studies in English annals. Cumming is ruined by the verdict, but he is not the only sufferer.

THOMAS PAINE'S IMPRISONMENT AND WASHINGTON.

NEW YORK, June 4, 1891.

"LEST I should forget it," writes Gouverneur Morris to Jefferson, "I must mention that Thomas Paine is in prison." The Americans in Paris, whom, as Joel Barlow says, Paine had often befriended, were not likely to forget that he was in prison. Morris was applied to, but seems to have been content that those who had been looking up to Paine as their minister should have a lesson. Jefferson had retired from the Cabinet, but Morris supposed him still there when he wrote about Paine. "I incline to think," he says (January 21, 1794), "that if he is quiet in prison he may have the good luck to be forgotten, whereas, should he be brought much into notice, the long-suspended axe might fall on him. I believe he thinks that I ought to claim him as an American citizen; but considering his birth, his naturalization in this country, and the place he filled, I doubt much the right, and I am sure that the claim would be, for the present, at least inexpedient and ineffectual."

In this announcement, which Morris barely remembered to make, he forgot to state that Paine had been imprisoned as a "foreigner." He had twice taken the oath of allegiance to the United States, had been outlawed in England for writing the 'Rights of Man,' had been invited as a foreigner to assist in founding a French Republic; his citizenship there was the honorary one conferred by the same decree on Washington; he was not "naturalized," had taken no oath of any kind; and his helping to frame a Constitution for France in a popular convention, where no Government existed, did not make him so much a French subject as Morris had become, before his appointment, by framing an official manifesto for the King. In saying that Paine, if quiet, was likely to be forgotten, Morris is conscious that the French Ministry had no charge against him, and the intimation that the axe had long been suspended over him is disproved by the fact that Barrère had shortly before consulted him on American affairs. That any reclamation he was likely to make, with such impressions, would be "inexpedient and ineffectual," Morris felt naturally "sure," and his casual note would be apt to prevent Jefferson from an interference that might bring down the axe on his friend. The next letter of Morris to Jefferson is dated March 6, 1794:

"Major Jackson—who, by the by, has not given me a letter from you which he says was merely introductory, but left it with the Comité de Sûreté Générale, as a kind of letter of credence—Major Jackson, relying on his great influence with the leaders here, stepped forward to get Mr. Paine out of jail, and with several other Americans [there were eighteen, all then in Paris] has presented a petition [to the Convention] to that effect, which was referred to that Committee and the Comité de Salut Public. This last, I understand, slighted the application as totally irregular; and some time afterwards Mr. Paine wrote me a note, desiring I would claim him as an American, which I accordingly did, though contrary to my judgment, for reasons mentioned in my last. The Minister's letter to me of the 1st Ventose, of which I enclose a copy, contains the answer to my reclamation. I sent a copy to Mr. Paine, who prepared a long answer and sent it to me by an Englishman, whom I did not know. I told him, as Mr. Paine's friend, that my present opinion was similar to that of the Minister, but I might, perhaps, see occasion to change it, and in that case, if Mr. Paine wished it, I would go on with the claim, but that it would be well for him to consider the result; that if the Government meant to release him, they had already a sufficient ground; but if not, I could only push them to bring on his trial for the crimes imputed to him; seeing that whether he be considered as a Frenchman, or as an American, he must be amenable to the tribunals of France for his conduct while he was a Frenchman, and he may see in the fate of the Brissotins that to which he is exposed.

Morris speaks of "crimes imputed to him," though none was alleged except his being a "foreigner"; the hint, however, was enough to frighten Paine's friends and prevent their pressing his demand for a trial, which would have revealed then what the French archives now reveal—that Paine's papers were searched and pronounced innocent, and that no accusation was ever brought against him except that of Morris. The phrase "conduct while he was a Frenchman" is self-contradictory; had Paine ever been a Frenchman Morris could not have "reclaimed" him. And here rises the main point in the above letter of March 6. Morris says he had reclaimed Paine as an American. Of this reclamation no copy was sent to our Government and none to Paine. In the previous September (23d) Morris had notified Jefferson that he would not in future send copies of his various applications on account of the postage it would involve. Although his application to the French Minister, in the Paine matter, was only eight sentences, the economical resolution was adhered to. Washington and Randolph (who had succeeded Jefferson) had thus no opportunity of knowing just what Morris had written. My readers will be the first to discover Morris's idea of claiming a countryman. The letter (dated February 14) was written, I may remind the reader, to M. Deforgues, Minister of Foreign Affairs, who had received from Morris his complaints of Paine's influence, and had signified to Morris that "our only aim has been to maintain between the two nations the most perfect harmony," and that steps about to be taken would confirm this.

"SIR,—Thomas Payne has just applied to me, for me to claim him as a Citizen of the United States. These (I believe) are the facts which relate to him: He was born in England. Having become a citizen of the United States, he acquired great celebrity there through his revolutionary writings. In consequence, he was adopted as French Citizen, and then elected Member of the Convention. His behaviour since this epoch is out of my jurisdiction. I am ignorant of the reason for his present detention in the Luxembourg prison, but I beg you, Sir, if there be reasons which prevent his liberation, and which are unknown to me, be so good as to inform me of them, so that I may communicate them to the Government of the United States. I have the honour to be, sir, your very humble servant,

"GOUV. MORRIS."

Five days later, February 19, was written the French Minister's reply:

"In your letter of the 26th of last month [Pluviose] you reclaim the liberty of Thomas Payne, as an American Citizen. Born in England, this co-deputy has become successively an American and a French Citizen. In accepting this last title, and in occupying a place in the Legislative Corps, he submitted himself to the laws of the Republic, and has renounced the protection which the right of the people and treaties concluded with the United States could have assured him.

"I am ignorant of the motives of his detention, but I must presume they are well founded. I shall nevertheless submit the demand you have addressed me to the Committee of Public Safety, and I shall lose no time in letting you know its decision."

Postal economy did not prevent Morris from forwarding to Philadelphia this reply of M. Deforgues, obviously written for transmission. It seems impossible that without the aid of Morris the Frenchman could have discovered in his note the reclamation of Paine's liberty "as an American citizen" which his reply certifies. Morris's disclaimer of jurisdiction over Paine is complete. His volunteered certificate of the prisoner's French citizenship is complete. He is even careful to spell Paine's name in the French fashion, "Payne." He merely, and with cold formality, asks the reasons for the detention, which, of course, were entirely within French jurisdiction, whatever Paine's citizenship. He makes the French Minister's mind easy on this point by merely requesting of his goodness information to send his Government. The Minister need expect no further action on his part. That the reply of M. Deforgues was collusive is suggested not only by its certifying a reclamation not made, but in speaking of Paine as occupying a place in the Legislative Corps. No unaided French Minister could have described the Convention as a "Corps Législatif." The phrase is calculated for Philadelphia, where it might be supposed that the French Constitution, already adopted (August, 1793), had by that time resulted in an organized government, office in which would involve an oath of allegiance. The unreality of the Minister's reply to the note of Morris, then in Paris (though he lived at Sainport, five hours away), is further shown by the fact that the speedy further information he promises was never sent nor demanded.

"I applied to Mr. Morris," Paine wrote to Madison long after, "but I know not what he wrote to the french minister; whatever it was he concealed it from me." Morris sent the prisoner the Minister's refusal, but Paine's careful disproof of its positions was never sent to M. Deforgues, nor to Philadelphia, but was found by Jared Sparks buried away in Morris's papers. Sparks prudently withholds Morris's "application," which, he says, "it must be confessed was neither pressing in its terms, nor cogent in its arguments"; while he concurs with Paine's argument, which is given. (Life of G. Morris, i, p. 418). The case had been so arranged by Morris that, even had it been submitted to his Government for action, no reply could have come until the latter part of the year. But it was not so submitted. His real surrender of Paine kept secret, he declares to the Secretary of State, March 6 (a delay of eighteen days after Deforgues's reply), that he has claimed "Paine" as an American, and encloses the Minister's false assertion of the same. This letter of March 6 reached Philadelphia late in June, when Washington was at Mount Vernon. On June 25 the Secretary of State writes to Washington that he has received a letter from Morris, of March 6, saying "that he has demanded Paine as an American citizen, but that the Minister holds him to be amenable to the French laws." Washington and Randolph had no reason to doubt the bona-fide character of the reclamation, but in the instructions of Monroe, just starting for France to supersede Morris, care was enjoined to obtain redress for "injuries to the persons of our citizens." And on July 30 was written to Monroe a letter of which Washington's summary (Sparks x, p. 474) says: "We have heard with regret that several of our citizens have been thrown into prison in France, from a suspicion of criminal attempts

against the Government. If they are guilty we are extremely sorry for it; if innocent, we must protect them. Collect intelligence, and act promptly and decisively. Let your path, however, be clear. Archibald Hunter and Shubael Allen are two of the sufferers." That Paine is not mentioned could only be because of Morris's supposed reclamation; for when Monroe did reclaim Paine as an American citizen, the prison-door opening at the word, his action was warmly approved by the President, in a letter of March 8, 1795.

This official reclamation was all that the French Ministers had waited for. In his letter of March 6 Morris had stated, concerning the application of the Americans in Paris to the National Convention for Paine's release, that they had been referred to two committees, one of which "slighted the application as totally irregular." This, again, was misleading. The President of the Convention had addressed the Americans with a warm eulogy on Paine's works, but said that both America and France were in alliance against England, reminded them that Paine was born in England, and deplored that this "apostle of liberty" had not understood rightly the revolution that regenerated France. They were referred to the two committees, and that of Public Safety told them "that their reclamation of Paine was only the act of individuals, without any authority from the American Government." This, Morris reports to his Government as "slighted the application as totally irregular," suppressing the fact that the matter had been virtually referred by the Committee to himself. By pretending that afterwards he had officially reclaimed Paine, and been refused, he prevented all attempts to move the American Government; and as no order came from Philadelphia, and no further mention of the matter was made by Morris, the Ministry, after allowing full time for the President to intervene, came to the natural conclusion that the execution of Paine would be agreeable to Washington. The Committee of Public Safety determined imprisonments and executions. It was controlled at this time by Robespierre. Barrère, who was on it, afterwards apologized to Paine for signing the warrant, saying "he felt himself in danger, and was obliged to do it." Why then did Robespierre resolve on Paine's execution? M. Masson, historian of the French Department of Foreign Affairs during the Revolution, says (p. 275) that Robespierre was particularly anxious to recover for the republic the initiative of the alliance with the United States which was credited to the executed King; and "although their Minister, Gouverneur Morris, was justly suspected, and the American republic was at this time aiming only to utilize the condition of its ally, the French republic cleared it at a cheap rate of its debts contracted with the King." There is reason to believe that Morris would have taken Paine's place in prison had it not been for Robespierre's desire to accommodate an ally which, despite French remonstrances, insisted on keeping him there as its representative. Genêt, who had so annoyed Washington, had been demanded for punishment by France, and, as he could not be got, his friend Paine, whom Morris had connected with Genêt's offences, seemed a fair victim to offer in atonement. Robespierre then wrote the death-warrant "in the interests of America as much as of France." The execution was escaped by the usual chalk mark being accidentally made, in the night, on the door of Paine's cell when it was open and flat against the wall; when closed the mark was on the inside, and at daybreak the destroyer passed by. Paine was ill of a fever at the time, and probably the physician, who was most attentive, was with him. Or there may have been connivance, for Paine remembered the extreme kindness of all around him, including his jailer, and the lamplighter, who incurred a risk in taking a letter to Monroe. A few days later Robespierre was executed.

Monroe reached Paris August 3, but shared no better fate at the hands of Morris than the other Americans. Morris postponed the duty of arranging for his successor's reception so long that Monroe addressed himself directly to the Convention, which responded at once, and received him on August 28. It was the belief of Paine that Morris himself was all along in danger, and it is true that he preserved his official character as long as he could while preparing to leave the country. M. Masson, in his History already quoted, says that Morris pursued the unparalleled course of never presenting or receiving any letters of recall at all. He also, after Monroe's arrival, made the most of Washington's private letter declaring continued confidence in him—a letter which enabled him to enjoy a fine career amid the European courts. It took Monroe some time to undo all the knots tied by his predecessor around Paine. The Robespierrians, who still controlled the Committee of Public Safety, withheld from Monroe the sham reclamation, and intimated that nothing could be done without "instructions." Of course, our Government, assured that Paine had been demanded and refused, had given no instructions concerning him. Morris was still in Paris to assure Monroe, as he had assured Jefferson, that Paine had been naturalized in France, and it required a statement from Paine like that which Morris had suppressed to disprove this. At length, however, the Robespierrians were removed from the committees. On the 5th of November Monroe wrote to the President of the Committee of General Security; on the same evening that Committee and the Public Safety Committee, in joint session, read his letter proving Paine an American citizen; on the morning of the 6th the prisoner became a guest in Monroe's house. From December 28, 1793, to November 6, 1794, Paine had been imprisoned entirely out of respect to the supposed wish of the United States. No offence against France of any kind was ever charged, and there was no hour in which a word from his Government would not have released him.

The suppression by Morris and Deforgues of the sham reclamation had far effects. On September 20, 1795, Paine wrote a brief letter to Washington, meant as a demand for explanation: "I cannot understand your silence upon this subject upon any other ground than as connivance at my imprisonment; and this is the manner it is understood here, and will be understood in America, unless you will give me authority for contradicting it." Unfortunately one or two sentences of the letter were angry, and Washington did not reply. Paine's anger was not without justification, for he had letters of warm friendship from Washington, highly appreciating his services to America; and Washington's refusal to answer the angry note was not unnatural, for he never dreamed that Paine had not been fairly reclaimed by his Minister, soon after the imprisonment. This silence was followed by the long and bitter letter to Washington of August 3, 1796, which, while it injured Paine in America, has caused many of his adherents to denounce Washington for cruelty and treachery. Hitherto, such facts as had appeared have been such as might have affected the reputation of Washington more seriously but for the unpopularity of the author of the 'Age of Reason.'

As Paine and Gouverneur Morris began their respective labors in Europe, so they continued. Gouverneur Morris, who wrote a manifesto for Louis XVI., went over to England, and there wrote another for Louis XVIII., assuming the throne of France; the two royal manifestoes by this American Minister may be read in his Life by Sparks. Paine on his liberation was invited back to his seat in the Convention, and went on trying to build the Republic.

MONCURE D. CONWAY.

A RAILWAY CELEBRATION IN ASIA MINOR.

BILEDJIK, ANATOLIA, May 21, 1891.

A CEREMONY took place here yesterday that was very much out of the common for this part of the world, and as I was the only representative of Anglo-Saxondom present and participating, it seems fitting that I should give some account of it to American readers. It was a celebration of the completion of the Anatolian Railway to this place, which is about 200 miles east of Constantinople. Biledjik is the cradle of the Ottoman power, for near here was born the first Othman, son of Orthogrul, in the year 1259, and here took place the first crystallization of one of the most masterful races the world has ever seen.

The railway is an extension of the old Ismid (Nicomedia) line. The work is now going forward to Angora, some 500 miles east of Constantinople, under the auspices of a German syndicate, of which the Deutsche Bank of Berlin is the leading member. The syndicate bought the Ismid line and made a contract with the Turkish Government to extend it to Angora on or before October, 1892. The terms of the concession are that the syndicate shall own and operate the line for ninety-nine years under a fixed maximum tariff of charges, the Government guaranteeing an annual revenue of 15,000 francs *gross* per kilometre. The completed portion of the line already earns more than the guarantee. At the end of the ninety-nine years the whole property passes to the Government free of cost. As the early completion of the line is now assured, people are already talking of its extension to Bagdad, 1,000 miles beyond Angora, but no plans have been made beyond the latter point.

It was my good fortune to travel from Berlin to Constantinople in company with Herr Schrader, the representative of the railway syndicate, who is also a distinguished member of the German Reichstag. It was at his invitation that I joined the party which left Constantinople by special train for this place on Tuesday morning. The train consisted of three parlor-cars, one of which was a dining-car, two ordinary first-class cars of the European type, and one observation car attached to the rear of the train. The turn-out was not so gorgeous as that which took President Harrison on his ten-thousand-mile tour, but it was ample for the intended journey. The party consisted of two Turkish pashas of the highest rank, one of whom is the Minister of Public Works, a number of subordinates wearing the fez, some of whom were of German birth, twenty or thirty German gentlemen who had received Herr Schrader's invitation, two German ladies, residents of Constantinople, and the writer of this correspondence. The train hands were all Turks, including the engine-driver. These functionaries all wore the fez, together with blue coats and white trousers,

but the conductor of the train wore a stovepipe hat, a dress coat, and black trousers—in short, full evening dress. The pashas and their entourage wore uniforms corresponding to their military rank, and all of them spoke French; some of them spoke German also.

The Anatolian land for about 150 miles is as beautiful, fertile, and well tilled as any country I have ever seen. It is well wooded and watered, and has excellent roads—much better than American country roads in general. But the habitations of the people are wretched, consisting for the most part of low, straw-thatched hovels, fit only for swine. In the larger towns the houses rise to the dignity of two, three, and even four stories, but they are unpainted, tumble-down structures, and have a gaping and jejune look in marked contrast to the smiling aspect of the surrounding natural world. The domestic animals, on the other hand, are sleek and well cared for. Herds of handsome, long-haired goats browse on the hills. Cows, bullocks, and buffaloes are seen everywhere and occasionally a camel.

The donkey is the ubiquitous beast of burden. There is no kind of movable property that he does not carry to and fro in the streets and up and down the mountains. If you want meat, you buy it from the back of a donkey; if you want water, you pour it from his back; if you want wood, you get it by the same conveyance. If you have to build a house, the donkey will bring on his back all the bricks and stone and mortar and lumber you require, and will afterwards bring the furniture. If you are building an Alpine railway, this little creature will carry the sand to mix with your cement up a zigzag path two thousand feet high from the streamlet at the base of the mountain, and if water is scarce, he will carry that also; all of which we saw at or near this place. One donkey train that I met was carrying kerosene oil in tin cans marked, "Double Refined Petroleum, Batoum." American petroleum destined for this place would not come by the way of Batum, so it occurred to me that Russian petroleum destined for Biledjik and the vicinity was marked with English characters, to which the natives are accustomed; this being a slight deception which may not involve any pecuniary disadvantage to them.

The principal natural productions of the country are wheat, barley, wool, silk, and the opium poppy. Some tobacco is grown, but this is not the chief seat of that branch of Turkish industry. Vineyards are numerous, and the wine produced is of good quality. Much of it is exported to France, and is there transformed into Bordeaux claret by some slight and not deleterious changes. Very likely it comes back here and is supplied to the hotels and restaurants of Constantinople. The Mussulman population in the rural districts never touch wine or any form of alcoholic drink. But the Mussulman population, I should judge, is not the most numerous part of the inhabitants hereabouts—the Greeks and Armenians preponderating. They live together in perfect harmony, so far as one can see, and I am assured that religious intolerance does not exist. Bigotry there is undoubtedly on both sides, or rather on all sides, but not intolerance. The Greek type of physiognomy is strongly marked, and is easily recognized by any one familiar with ancient sculpture. I saw a girl in the Greek quarter of Stamboul the other day whose face might have served as a model for the Venus of Milo. She was buying a piece of meat from the back of a donkey, and she gave me a glance as I passed that brought back dreams of Anacreon from my college days.

The last fifty miles of our journey was through a mountainous district, which included one precipitous defile of a very picturesque character. The road rises at a pretty heavy grade, following the windings of a stream, of slaty color, like those of the Alps and of the Rocky Mountains. There are numerous short tunnels and high bridges, the latter of iron or of stone exclusively. When we arrived at Biledjik station we were met by carriages, which took us to the town, which is about two miles distant, and at a still greater elevation. I should say that we ascended between one and two thousand feet in this winding but excellent carriage drive. Here we found a smart Turkish town planted on the mountain ridges, the houses rising one above the other, and the streets narrow and hummocky, like those of Stamboul. At the end of one of these streets we were received at the headquarters of the railway construction forces, where we were regaled with Strassburg beer and Gruyère cheese, and music from a Berlin piano. We were next escorted to the Town Hall, where we received the usual treat of coffee served in tiny cups, after which we were severally presented to the chief functionary of the place, who invited us to inspect the manufactures of Biledjik. These consisted chiefly of upholstery goods, of Oriental designs, extremely beautiful and very durable as well. There are many luxurious houses in America whose chairs and sofas are covered with the fabrics of Biledjik or other towns of Asia Minor, the owners probably thinking that they have come from Paris or Brussels.

After some time spent in this way we were taken back to the valley, where we passed the night in houses erected by the railway people to serve as models and examples for the inhabitants of the country, the object being to stimulate their wants. The first want to be stimulated here is that of decent lodgings. Before retiring I had the curiosity to look through the grounds of the Biledjik railway station to see what sort of traffic the line had developed. To my surprise I found hundreds of tons of wheat piled up in sacks and covered with tarpaulins. I had forgotten that this is the native country of the wheat plant. Thirty or forty yoke of buffaloes and bullocks were lying on the ground, beside their carts, chewing their cuds. Some of the drivers were sleeping in the open air on the sacks. The next day we saw hundreds more of these teams coming along the valley road from the upper country similarly laden. If this is done in the green tree, what shall be done in the dry? Will not Asia Minor, when provided with railways, become a formidable competitor of America in the wheat markets of the world? Of this I think there can be no doubt.

The next morning we were out early, prepared for a walk and an inspection of railway-building in the mountains of Asia Minor. I will acknowledge that if I had known beforehand what it meant, I should have declined my share of it. An Alpine journey of six kilometres along a goat path, not wholly free from danger, and under a blazing sun, is not suited to my time of life—at least I supposed so, but I find myself none the worse for it. Herr Schrader's inspection of the work in hand was not by any means a formality. Everything visible was examined, so far as this could be done without instruments of precision. All the tunnel work and bridge work was closely inspected, and the German engineers interrogated upon every essential point. The structure seemed to me to be as solid and thorough as possible, while the difficulties of engineering are as great as any that I have ever observed except some sections of the Canadian Pacific Railway and of the higher Swiss lines.

The skilled workmen are mostly Italians, the common laborers being natives of the country. I asked one of the engineers how the latter compared with German laborers of the same class. "Better," he replied; "they don't drink, don't shirk, don't strike. They are as strong as Europeans and as quick to learn. We have no fault to find with them. They are happy and contented because they are getting good wages, steady work, and sure pay." There are 5,000 of these men now employed between Biledjik and Angora, all the sections of the line being under simultaneous construction.

Our journey of inspection lasted three hours, and was concluded at another Turkish town called Kupplu, or Kubla. I adopted the latter name for private use, in honor of the Khan who did in Xanadu a stately pleasure-dome decree. I was told by one of the German wearers of the fez that it would be impossible to write the name of the town in exact English. Therefore Kubla will answer as well as anything. The resources of Kubla had been drawn upon to prepare a banquet for us. It was given in a large wooden building tastefully decorated with the foliage of the country. The tables were arranged in the form of a parallelogram. The Turkish Minister of Public Works took the head of the table. The menu was as follows:

Cold meats, including fresh lobster from the Bosphorus.	Beer from Marseilles.
Fâté de foie gras.	
Fish, boiled.	Rhine wines of several sorts.
Chicken fricassé.	
Roast turkey.	Giesshübler water.
Green peas.	
Roast lamb.	Bordeaux wines.
Asparagus.	
Champagne.	[This was served as a separate course as a signal for toasts.]
Ice cream.	
Coffee.	

It will be noticed that, although the Turks in general do not drink wine, they provide it liberally for their guests. They make an exception in favor of champagne when the Sultan's health is proposed. At all events *our* Turks did, one of the Pashas leading off and himself proposing the toast, which he responded to in the German language. There were half-a-dozen speeches made, most of them in German, one being in French and one in Turkish. The dinner lasted two hours, and was "a grand success." The theme of all the discourse was the regeneration of Turkey by railways, which the Minister assured us was one of the things nearest the Sultan's heart. And well it may be, for if Turkey can have a few years of peace and internal development, her strength will be greatly augmented. A gentleman who knows the country said to me that if this development had been begun twenty-five years ago and steadily prosecuted, as it will now be prosecuted, Turkey would be able to defend herself against Russia single-handed. Even as things now are, the country will cut no mean figure in the next European conflict, if Constantinople is the objective point, as most people think it will be. I read in a Paris newspaper, the other day, a long and seductive article, showing how much it would be for Turkey's interest to remain neutral in the next clash of arms. Turkey, this writer said, could put 500,000 excellent and well-armed soldiers in the field. These would guarantee her against attack as long as she remained neutral. By remaining neutral she would win the friendship of Russia, etc., etc. The Turkish statesmen may be trusted to know on which side their bread is buttered,

when the time comes. They want peace, but they know that it is to be had only by the utmost preparation for war. The present Sultan is so far progressive that he gives his confidence and support to a wise and progressive Prime Minister, Kiamil Pasha, whose efforts for the internal development of Turkey are worthy of the highest praise.

What Turkey needs most of all and finds most difficult to get is civil-service reform. Her natural resources are great, and capital will be found to develop them as fast as security and the regular administration of law are afforded. Her common people have lost none of their old-time vigor, courage, and alertness. The "sick man" is not so sick as Czar Nicholas imagined forty years ago, but the internal government of the country is still shockingly bad—perhaps no worse, however, than that of Russia. What difficulties stand in the way of civil-service reform we in America know full well. How much greater must they be in a country which has never been trained to self-government, does not know what it means, and which has no organized public opinion. Cutting off the heads of corrupt officials would avail nothing without a supply of honest ones to draw upon. The only salvation of Turkey is education. It was education that built up Bulgaria, and this was afforded by the (American) Robert College, which looks down upon the waters of the Bosphorus. There are now hundreds of schools in the Turkish Empire that owe their origin to American missionary zeal. The Turkish Government has been stimulated by the example, and now schools are abundant in Constantinople for both boys and girls. What they may be doing elsewhere I am not informed.

But this letter is not intended as an essay on Turkey in general. The railway enterprise now on foot, which will soon be completed to the ancient battle-ground of Bajazet and Tamerlane, is a great civilizer in itself. Those who may look twenty-five years hence upon the country it traverses will see a wonderful transformation. HORACE WHITE.

GENERAL MARBOT.

PARIS, May 28, 1891.

GENERAL MARBOT was one of the minor stars of the Napoleonic time; he often approached the great Emperor, he served on the staff of five of his marshals, Bernadotte, Augereau, Murat, Lannes, and Masséna. I knew that he had written memoirs, for I had often heard stories which had been read in the original manuscript by the Duc d'Aumale. Marshal Canrobert was also one of the happy few who knew these curious memoirs. They are now published, somewhat to my surprise, for I thought that they never would be, and that they would be read only in the two copies which exist in manuscript. King Louis Philippe surrounded his children, who were all destined for the army, with the generals who had served in the campaigns of Napoleon, with the survivors of the Grande Armée; and Marbot, who was for eleven years the aide-de-camp of the eldest of his sons, the Duc d'Orléans, assumed in their eyes almost epic proportions. It is not surprising when we read now what these men did between 1800 and 1815; their history is like a dream, it is an Odyssey and an Iliad at the same time. They will some day, when history becomes a mere legend, appear like the heroes of the Round Table, like the famous *preux* of Charlemagne.

Marbot was born on the 18th of August, 1782, at the little castle of Larivière, where lived his father on the banks of the Dordogne, on the frontier of Limousin and Quercy (now the Department of Corrèze). His family, though it bore no title nor any *particule*, was noble—that is to say, lived nobly, which at the time meant that it lived on its own revenue, without exercising any industry. Not far from the Marbots lived a family called De Certain, which counted Saint-Roch among its ancestors. Marshal Canrobert, the only remaining marshal in the French Army with Marshal MacMahon, is issued from these Certains; his name is really De Certain de Canrobert, though he always had himself called simply Canrobert. (His only daughter was married not long ago, and she was called in the *faire-part* Mademoiselle de Certain de Canrobert.) Canrobert was the name of a small estate belonging to the family of Certain.

Marbot was very young when the Revolution broke out. His father became a member of the Legislative Assembly, but the greater part of his relations emigrated. While his father was in the army in the Pyrenees, his mother took him to Rennes, where he remained four years. His father, having been put at the head of the army at Toulouse, sent for him and placed him in the school at Sorèze, the only great military school which the Revolutionary Government had preserved. During his short visit to his father, he saw his father's aides-de-camp Augereau and Lannes, who were both destined to become marshals.

"Augereau, after having emerged from the prisons of the Inquisition at Lisbon, had just fought in La Vendée, where he had been noticed for his courage and his facility in handling troops. He was a very good tactician, having learned the science in Prussia, where he had long served in the footguards of the Great Frederick. He was called the Great Prussian. He had an irreproachable military *tenue*, always *tiré à quatre épingles*, powdered, a long queue, great top boots very shiny, a very martial bearing. . . . Lieut. Lannes was a lively young Gascon, witty, without education or training, but desirous of learning at a time when nobody was."

The school at Sorèze had been founded after the Jesuits had been turned out of France. The Jesuits had always claimed the privilege of educating the French youth; the Benedictines wished to prove that they could be good educators. Sorèze became very prosperous; the Benedictines were so popular that when all the property of the Convent was sold, the principal, Dom Ferlus, was allowed by his neighbors to buy Sorèze and its immense estates for a nominal sum, and all went on as before. The monks dressed like laymen, and the name of *citizen* replaced the name of *Dom*. Dom Ferlus even affected some revolutionary zeal. "The walls were covered with republican sentences. It was forbidden to pronounce the word *monsieur*. The boys went to commons or to walk singing the 'Marseillaise' or other republican hymns." Sorèze had been from the beginning a military school at which horsemanship, the art of fortification, and drilling were taught. The boys became very enthusiastic on hearing the account of the victories of the republican armies.

Marbot left Sorèze at the age of sixteen, and joined his father in Paris, where he commanded the Seventeenth Military Division. In 1799 the Republic was still in existence; there was a Directory of five men, a Council of Ancients, and a Council of Five Hundred. Gen. Marbot received many people; his son made the acquaintance of Gen. Bernadotte, of Joseph and Lucien Bonaparte, of Mme. Bonaparte, etc. Everybody felt that a change was imminent. Sieyès was looking for a general who could take in hand the reins of government. Bonaparte seemed marked by destiny, but he was at the time in Egypt; Masséna was a good soldier, but no politician; Moreau was lazy; Sieyès determined on choosing Bonaparte. He sounded Gen. Marbot, but received no encouragement; Marbot resigned the command of the military division of Paris, and asked for an active division. He was sent to the army of Italy.

The destiny of young Marbot was then fixed; his father made him a hussar in a regiment which formed part of the division that he was to command in Italy. Young Marbot was very proud of wearing for the first time, on the 3d of September, 1799, the uniform of the famous hussars of Berchiny. The journey was made without any other incident than the meeting of Marbot and Gen. Bonaparte at Lyons. Bonaparte was coming from Egypt unexpectedly, having been recalled by a letter from Sieyès. The meeting of the two generals was cold. Marbot was leaving Paris because he would not be the instrument of a *coup d'état;* Bonaparte was eager to make this *coup d'état*. The hussars of Berchiny, now called the First Hussars, wore the queue, two long tresses of hair falling on both sides of the face, and long moustaches. Young Marbot had the face of a girl; he was obliged to wear a false queue, false tresses, and to paint two long moustaches on his face with the blacking which served for the boots. He had also to fight a duel, in order to conform to the rules of the regiment. But he did not wait long to see war in earnest. His father was under Masséna during the famous siege of Genoa. Young Marbot saw all the horrors of this siege, and he saw his father wounded and dying of typhus fever. He lived several years, he says, during the two mortal months of the siege. The heroic resistance of Masséna allowed Bonaparte to cross the Alps and to arrive in Italy, where he fell on the rear of the Austrian army. He did not arrive in time to save Masséna, but Masséna had resisted long enough to enable him to win the battle of Marengo.

Marbot and another officer were sent from Genoa to Bonaparte and joined him in Milan. The First Consul spoke to young Marbot of the loss he had sustained during the siege. "He promised to be a father to me, and he kept his word." Marbot went with him to Montebello and afterwards to Marengo. The French were on the point of being beaten, "and they probably would have been if the 29,000 men of the corps of Ott [who had besieged Genoa] had arrived in time on the field of action. The First Consul, who was in constant dread of seeing them appear, was very sad, and only became gay again when our cavalry and the infantry of Gen. Desaix, whose death he was still ignorant of, decided the victory by breaking through the Austrian grenadiers of Gen. Zach." Marbot was afterwards aide-de-camp *à la suite* of Gen. Bernadotte. He does not give a very flattering portrait of the man who was afterwards to mount the throne of Sweden. Bernadotte formed in Tours the reserve of the army of Portugal, which country, helped by England, had declared war on Spain. Marbot left the staff of Bernadotte and joined a regiment in the army of Portugal. He went from Nantes to Bordeaux and to Salamanca, where he remained several months till the Prince of Peace, who had called the French into Spain, became alarmed by their presence and concluded a treaty of peace with Portugal, without consulting the French Consul. He succeeded in having this treaty ratified by the Ambassador of France, Lucien Bonaparte. The First Consul was very angry, and this was the beginning of his misunderstanding with his brother Lucien.

The French Army recrossed the Pyrenees, and Marbot was sent to Brittany. He gives some curious details on a military conspiracy which is called the conspiracy of Rennes. The real chiefs of it were Bernadotte and Moreau, both jealous of the high position which had been attained by the First Consul and by the small place which he had given to them in the conduct of the public affairs; but they kept in the background—the generals and colonels of the army of Brittany took the lead. Several regiments were to make a pronunciamiento in Rennes, and all the divisions were to follow. An accident caused the police of the First Consul to become cognizant of the conspiracy; some arrests were made, and the pronunciamiento did not take place. The First Consul sent the discontented regiments to San Domingo, where almost all the men died of yellow fever. Marbot was appointed aide-de-camp to Gen. Augereau, and what he tells of the early history of this general is certainly as extraordinary as any novel. Pierre Augereau was born in Paris, in 1757, his father being a fruiterer. He entered at the age of seventeen the regiment of carbineers of Monsieur, and became a non-commissioned officer. He had to fight several duels, as duels were at that time a mania in all regiments. Some of the regiments had traditional rivalries, which had from time to time to be satisfied in this way. There was an old feud of this sort between the gendarmes of Lunéville and the carbineers. A duel had to be fought, and ten of the best swordsmen of the carbineers were chosen; they drew lots, and out came the name of a non-commissioned officer named Donnadieu; Augereau observed that Donnadieu was a married man with five children, and was allowed to take his place. His adversary was a professional duellist; he had killed a few days before two sergeants of the Gardes Françaises. The provocation took place in a café. Augereau had his cup before him. The gendarme came in and sat on the little table, turning his back on Augereau. Augereau took his coffee-cup and emptied it on the gendarme's uniform. The gendarme, on the way to the place of combat, asked him: "Where do you wish to be buried; in town or in the country?" "In the country," said Augereau; "I have always liked fresh air." Augereau kept very calm during the duel; his adversary became more and more enraged, till finally he made a false movement. Augereau passed his sword through him, and said: "You shall be buried in the country."

It would be difficult to imagine a more checkered life than that of Augereau. One of the officers struck him; he killed him in self-defence, fled, went to Geneva, to Constantinople, to the Crimea. He served in the army of Suvaroff, was wounded in the assault on Ismail, served afterwards in the guards of the Great Frederic, became a dancing and a fencing master in Dresden, and returned to France after the general pardon given to all deserters on the occasion of the marriage of Louis XVI. He recovered his grade in the French Army, was sent to Naples as instructor, married the daughter of a Greek merchant, fled with her to Lisbon, was thrown into the prisons of the Inquisition, was set at liberty and returned to France, was appointed captain, and served in Brittany and in Italy, and became a general.

Correspondence.

OF CONSEQUENCE, 'CONSEQUENTLY.'

To the Editor of The Nation:

Sir: My letter in No. 1349 contains a statement on which I wish to make a remark. I there express a strong suspicion that Boswell, in reporting the conversation of Dr. Johnson, should not have represented him as saying "*of* consequence," instead of "*by* consequence." But a mislaid memorandum, just found, refers me to the following passage in a letter from Dr. Johnson to Boswell, dated April 8, 1780: "Do not lose sight of her; your countenance may be of great credit, and *of consequence* of great advantage to her." Not impossibly, there ought to be a comma after "consequence," in which case it would be one with "importance"; but this is not at all probable. More likely, Boswell put "of" for "by." Passing by numerous far earlier writers, I am aware that the "*of* consequence" in question was used by Cowper, Thomas Tyrwhitt, and Southey, before 1800; that it has, since then, been used by Sir James Mackintosh, James Mill, Sir Walter Scott, Bentham, William Godwin, etc., etc.; and that it abounds in the pages of Goldsmith, among Dr. Johnson's contemporaries. For something like a century, or upwards, I may add, it has, apparently, been more freely favoured by Scotch writers than by English. At present it is a vulgarism. —Your obedient servant, F. H.

Marlesford, England, May 20, 1891.

THE OBJECTIVE POINT.

To the Editor of The Nation:

Sir: In conversation yesterday with perhaps the best-known member of Congress from Massachusetts, I was bitterly reproached with devotion to English political methods, and exhorted to return to the true American way. In reply I urged the distinction between principles and methods. The *principle* of personal responsibility and leadership is no more distinctively English than it is Dutch or Japanese. The method of applying that principle which I advocate is just as different from the English and just as much American as any of the political expedients employed by Mr. ——.

The Marquis of Salisbury has been making a speech at Glasgow, in which he said that Parliament has two functions—that of doing business and that of making ministries—and lamented that its action upon the former was always governed by its effect upon the latter. Now Congress would, or need, have no more power in making the Cabinet having seats on the floor than it has now, except indirectly through an appeal to the people, and it would be quite as likely to hurt as help its case by factious opposition to business measures supported by the Government. The Cabinet would hold a more independent and dignified position than the British Ministry, and it is precisely for that reason that Congress refuses to listen to any such proposition. Though each member, in fact, represents only a single district of a single State, he thinks he represents the people of the United States just as much as the President or the Cabinet, and don't want to see around him in Congress any but those who fully share his sentiments.

I cannot let this occasion pass without quoting again from your last week's issue. Speaking of the Farmers' Alliance and similar popular movements, you say:

"They grope about like lost travellers in a thick forest, give us laughable expositions of political economy, satirize history as to money questions, and make their platforms the oddest jumble of good and bad 'issues.' . . . But was anything very different to be expected from a class of voters isolated from contact with affairs, not given to reading, and who for a quarter of a century have been more stirred by sentimental memories of the war than by the crushing material burdens of a war tariff?"

I go further and say that you cannot expect and will not get anything different from any class of voters, the most competent of business and professional men in cities, so long as they are left to frame their "issues" in mass meeting. You can get only the same result from Congress itself, so long as that body consists of 330 precisely equal members without official guide or leaders of any kind, though that result may of course be modified by skilled manipulators on behalf of private interests. There must be some high officials whom the nation can look to as its agents, and personally responsible not to Congress, as the British Ministry is to Parliament, but to the people at large, who shall be ready to receive all such propositions and put them in a shape either to stand the test of public cross-examination or to be exposed and overthrown by it. Mr. Gladstone once expressed this by saying that he was like a cloud, drawing ideas like moisture from the people in the form of vapor and returning them in the form of rain. G. B.

Boston, June 6, 1891.

Notes.

G. P. Putnam's Sons will publish directly 'Church and Creed,' three sermons by the Rev. R. Heber Newton. They have also in press the third volume of the Talleyrand Memoirs and 'The Living World: Whence It Came, and Whither It is Drifting,' by Prof. H. W. Conn of Wesleyan University.

Henry Holt & Co. announce a 'History of the Politics of the State of New York,' by Prof. Charles H. Levermore of the Massachusetts Institute of Technology—a work which promises much by its title, and ought to provoke a series on the same line for each of the States, though not a made-to-order series. They have also in press 'On the Stage—and Off,' by Jerome K. Jerome.

Mr. Geo. O. Seilhamer, 112 North Twelfth Street, Philadelphia, will speedily publish the third volume of his four-volume 'History of the American Theatre,' entitled 'New Foundations.'

Benj. R. Tucker, Boston, has nearly ready 'What's Bred in the Bone,' a novel by Grant Allen; and a translation of the late Karl Heinzen's 'Rights of Women and the Sexual Relations.

J. B. Lippincott Co., Philadelphia, have nearly ready the seventh volume of 'Chambers's Encyclopædia,' which carries the work to the title Pearson.

Charles E. Merrill & Co. have postponed publication of the two volumes of Ruskin's Poems until after July 1, in order to take advantage of the new Copyright Law. The poems are chronologically arranged, and dated by the author's age.

'Browning as a Philosophical and Religious Teacher' is the subject of a work by Prof. Jones of University College, which will be issued by Macmillan & Co.

The Historical Printing Club, 97 Clark Street, Brooklyn, issue in a limited edition 'Wills of George Washington and his Immediate Ancestors,' with much related matter.

T. Y. Crowell & Co. have just completed a new edition of Dickens's Complete Works in fifteen and thirty volumes, illustrated after Phiz, Chruikshank, etc., but having also "65 new cuts from etchings from Pailthorpe contained in no other edition." Either sets or single volumes may be purchased.

Dickens literature is enriched by the publication of a revised and enlarged edition of a book issued privately in 1883, 'The Childhood and

Youth of Charles Dickens,' with retrospective notes and elucidations from his books and letters, by Robert Langton (Scribners). The author has been an indefatigable inquirer into the early life of Dickens, and has succeeded in tracing the movements and dwelling-places of the family, the schools and early London life of the novelist, the servants, obscure companions, and in general all the youthful surroundings amid which Dickens grew up; and the result of his labors is to correct Forster's 'Life' in several details, to increase our knowledge of Dickens's originals, and to identify many of the descriptions of places and the names in the works. He divides the subject into three convenient parts: first he narrates the life of Dickens up to the date of his beginning to write; secondly, he describes Gad's Hill; and thirdly, he passes each of the works in review to determine anything autobiographical in its pages. There is a full index, and the pages are plentifully besprinkled with illustrations of the scenes, buildings, curiosities, etc., natural to such a volume.

A selection from the poems and prose writings of Leigh Hunt, in the beautiful though too small type of the Temple Library (London: J. M. Dent & Co.; New York: Macmillan), is edited by Reginald Brinsley Johnson and adorned with a portrait and small etchings which add to its attractiveness. The introduction is by the hand of an admirer of Hunt, and sufficient in information, but it might well have been more critical and have taken more the character of a literary portrait. The selection is very good, but Hunt wrote with much the same style and matter always, and hence selection does him little service. In poetry one sees almost too plainly how very thin his talent was, and how very irritating to a man of taste his defects in composition were. The verses are really most valuable for the light they throw on Keats's first style. In prose there is little that deserves to survive. Neither Hunt nor Hazlitt reached the excellence and charm that keep an essayist alive in literature, and they were distanced by Lamb, who remains, both in the critical essay of literary taste and in the light social essay, the only master of his time. No one, however, who loves books will begrudge space on his shelves for these two pretty volumes in memory of such a friend of books and authors as Hunt.

The second volume of the new Cambridge Shakespeare (Macmillan), reëdited by Mr. Wright, requires only the mention that so beautiful and cheaply issued an edition deserves in order to recommend it to the public as much as it is already recommended by its own merit to scholars. It will continue to be issued one volume each quarter, and any one who wishes a library Shakspere cannot do better than purchase at this easy rate.

Perhaps the most interesting feature of the second and last volume of the new edition of Dr. W. Smith's 'Dictionary of Antiquities,' just issued (Boston: Little, Brown & Co.), is the ten-page Appendix, in which the fresh doctrine afforded by the newly discovered Aristotle papyrus is set forth so far as it corrects or confirms statements made in the body of the work. The material is discussed under about fifty subjects, alphabetically, and the names of H. Hager, W. Wayte, and G. E. Marindin are sufficient vouchers for the sagacity and discretion with which the revision has been made.

Mr. John R. Howard has taken from the volume of 'Patriotic Addresses by Henry Ward Beecher in America and England from 1850 to 1855,' published four years ago, his own prefatory review of Mr. Beecher's life, and made a separate volume of it—'Henry Ward Beecher: A Study of his Personality, Career, and Influence in Public Affairs' (Fords, Howard & Hulbert). Several portraits are inserted.

We are glad to observe that a twenty-five-cent edition of Mr. Henry George's 'Protection or Free Trade?' has been put on the market (New York: Henry George & Co., 42 University Place). It would be hard to name a work better adapted to serve as an introduction to the controversy.

A grandniece of James G. Birney has offered a prize of one hundred dollars for the best contribution to American history by a resident student of the Johns Hopkins University. The competing manuscripts must be submitted to Prof. H. B. Adams on or before May 1, 1892.

The current *University Circular* of the same institution contains an extended analysis of the important historical collection lately bestowed by Col. John Thomas Scharf. Though it is richest and most extensive in the Southern field, the New York and Pennsylvania sections are extremely valuable.

In the June *Forum* Mr. Henry Holt forecasts the operation of the new Copyright Law. He thinks that when the habit of paying foreign authors for their books is revived, it will extend even to works which they do not copyright, as was the practice in the period from about 1860 to 1876. There will be some books that will not pay for type-setting here that will tempt the pirates, but they will, in Mr. Holt's judgment, be so few that the worst element in the publishing trade will be driven out of business. He is even more sanguine than this, for he expects the new law to revive the book-buying habit, and to divert the American citizen from the great shops and the news-stands to the bookstores. We are going to pay more money for good books instead of paying less money for bad pamphlets. And, after all, although the price of first editions will be higher, the books will be made better; and books that prove popular will be furnished at popular prices.

A timely paper on "International Liabilities for Mob Injuries," by Prof. E. W. Huffcutt of the Law Faculty of Indiana University, will appear in the July *Annals* of the American Academy of Political and Social Science.

University Extension will be the title of the new journal devoted to the movement which goes by that name. Its headquarters are with the American Society at No. 1602 Chestnut Street, Philadelphia.

Pantobiblion is a new monthly magazine which cannot be overlooked by a certain class of students and workers. It is an "international bibliographical review of the world's scientific literature," edited (apparently from St. Petersburg) by A. Kersha, and published in various places (New York: D. Appleton & Co.). The first section is an elaborate classified register of new books; the second, brief critical notices, generally in the language of the book itself—and some fifteen languages are thus involved; the third, tables of contents of current scientific periodical literature, which will hereafter be followed by critical reviews of leading articles and by a scientific miscellany. This is a very remarkable programme, and as a co-operative scheme a great curiosity. The English portion, apart from the division of words, is generally very correctly printed.

We have received from E. Rouveyre, Paris, the April and May issues of the 'Petit Manuel du Bibliophile et du Libraire,' of which we have already spoken as a collector's guide to the current value of old and new books, engravings, etc. The first volume will be complete in two more numbers.

Sun and Shade for June (New York: Photo-Gravure Co.) furnishes plates above the average in interest and execution. We remark portraits from life of Miss Marlowe, the actress, and of Mr. R. Swain Gifford, together with one of the latter's characteristic paintings, "The Glen"; a view of the *Tribune* and *World* Buildings from the top of the *Times* Building; Meissonier's "1807," etc.

Our recent mention of a setting to music of a poem by Whittier has brought us the reminder of a much earlier instance, viz., of his "Laus Deo." The composer was Mr. F. Boott, and the publishers Oliver Ditson & Co., in 1868.

That clever woman, the wife of Count L. N. Tolstoi, the author, recently made a successful business trip to St. Petersburg. She secured an audience with the Emperor, who was extremely amiable to her, and promised to protect her husband from all the annoyances to which the Committee of Censors has been subjecting him.

Capt. Stairs, one of Mr. Stanley's officers in his last expedition, and an American by birth, is about to return to Africa in the interests of the Anglo-Belgian Katanga Company. This has been organized for the purpose of occupying Katanga, a native kingdom lying in the southeastern corner of the vast territory included in the Congo Free State. It is a part of the high plateau which forms the watershed between the Congo and the Zambesi, and its especial value consists in its copper, which is said to be very abundant. Mr. F. S. Arnot, who established a mission in the kingdom five years ago, describes the malachite as being found in large quantities on the tops of certain bare, rugged hills. The natives dig little round shafts seldom deeper than fifteen or twenty feet. Traders come for the copper, and also for salt, in which the country is also very rich, from the east and west coasts and from as far north as Uganda. Dr. Livingstone, who died not far from its southeastern frontier, refers to it in his 'Last Journals' as a gold-producing country. It is understood that two other Belgian expeditions are on the way to the same region, into which, until very recently, Europeans could not enter without great difficulty, only two having succeeded up to the time of Mr. Arnot's visit in 1886.

The summer session of the School of Applied Ethics will be held at Plymouth, Mass., beginning on July 1. We have already called attention to it as quite the most promising of such gatherings. It will have three departments—of Economics (in charge of Prof. H. C. Adams), History of Religions (in charge of Prof. C. H. Toy), and Ethics (in charge of Prof. Felix Adler). In this last the Indian question will be discussed under several heads by Prof. J. B. Thayer and Mr. Herbert Welsh. Communications should be addressed to Prof. Adams, at 1602 Chestnut Street, Philadelphia.

The sum of nine thousand dollars is needed to secure the purchase (at $80,000) of the Morse collection of Japanese pottery, now on deposit at the Boston Museum of Fine Arts, for that institution. There is but one judgment of the rank of this collection, in comparison with any and all those of the great Continental museums, or with those of the British Museum and South Kensington combined. Its historical and artistic merits are alike extraordinary, and it would be a great pity if it should leave the country, or should even not be retained where it now is. Subscriptions may be sent to Mr. Henry L. Pierce, 159 State Street, Boston.

—A history of the island of Antigua, in the West Indies, is now in preparation by Mr. Vere Langford Oliver, an English gentleman of independent fortune, who has for some time past been engaged upon his hobby of tracing out the pedigrees of some two hundred and thirty families connected with that island. As many of our American families are sprung from early settlers in the West Indies, not a few persons will find in the forthcoming work materials for genealogies. The Olivers themselves, of whom the author is one, were not only of Antigua, but also of Dorchester, Mass. In like manner the Prynns are also of Connecticut, the Redwoods of Rhode Island, and the Royalls of Massachusetts. The Winthrops of New England of course take their place. Mr. Oliver's researches have been to him a labor of love. Beginning by looking up his own pedigree, he went on to trace those of the families with whom the Olivers were allied. Fascinated by the pursuit, the love of his subject grew upon him, until his inquiries extended to the history of Antigua in general. Meanwhile, the papers of the Public Record Office, London, the wills in the Probate Registry at Somerset House, and the stores of the British Museum have all been made to contribute to the elucidation of the history of the old English colony. Not content with this, however, Mr. Oliver, in 1889, must needs leave his luxurious home, Whitmore Lodge, at Sunninghill, in Berkshire, and proceed to Antigua itself, where he spent some months, making, with the help of his wife, an enthusiastic collaborator, some thousands of extracts from the wills and other records of the island. The work will appear in crown folio. The pedigrees will be arranged alphabetically. The edition will be strictly limited to 250 copies, all numbered and signed, price £3 3s. each. Special interleaved copies will be issued at £3 10s. each. A list of subscribers will be printed in the work. Mr. Oliver, it should be added, would be glad to receive from any Americans interested in the History genealogical notes and impressions of seals or book-plates referring to any of the families of which his book makes mention. An original list of the English colonists who, after the Treaty of Breda, were transported with all their slaves to Antigua from Surinam—which latter colony, it will be remembered, was then given up to the Dutch in exchange for New York—was recently found by Mr. Oliver in the Public Record Office, bound up with papers dated 1729. With these documents were also found two original papers dated 1636, including a list of persons bound for the Caribbee Islands, and a letter describing the miserable condition of the colonists.

—Athletics at Cornell seem to be in a bad way financially, and Prof. Wilder offers, in the Ithaca *Journal* of June 4, to head a subscription list with $50 towards extinguishing the debts of the football team, baseball nine, and navy. He accompanies this tender, however, with conditions which involve an interdiction of intercollegiate contests for three years. His grounds for such a proposal are spread over five columns of the *Journal*, and will well repay perusal by all who have the welfare of our colleges at heart. He cites a large amount of testimony in accord with the view, long held in these columns, that the craze for athletics subverts the end for which colleges exist, and is attended by numerous well-defined evils of greater or less degree. President Eliot is, of course, one of his chief witnesses. Prof. Wilder's own observation, however, has great weight, as when he records the fact that "during the present term the baseball nine have been absent for about one-fifth of the time of instruction, besides taking part at the college in fourteen match games with nines from abroad." And every one knows that this humiliating picture is true not of Cornell alone: "During the college year just closing, the two papers that are supposed to represent the purely literary element (as distinguished from the *Crank*, the organ of the departments of applied science) have been occupied largely by athletic chronicles, by appeals for attendance upon the games and for subscriptions, spiced in the Daily with denunciations of the unresponsive, and innuendoes or open complaints against other institutions." And on the delicate subject of the extent to which boys make choice of a college by reference to its athletic standing, Prof. Wilder remarks that, with a few exceptions, "so far as order, scholarship, and reputation are concerned, it would have been well for Cornell to pay the tuition at any other institution of such as have come or remained here wholly or mainly on account of intercollegiate athletic contests."

—A late number of the *Zeitschrift für Philosophie und die philosophische Kritik* devotes more than a third of its pages to the philosophical and ethical views of H. Bender, in the form of a long article entitled "On the Nature of Morality and the Natural Process of Development of Ethical Thought," and of a very laudatory review of a published work by the same writer, 'Towards the Solution of the Metaphysical Problem.' H. Bender is a woman, and her Christian name is Hedwig. She pursued her philosophical studies entirely without any of the inspiration that comes from fellow-students or from teachers, and even without the knowledge of her own family. How little is known of her personality appears from the fact that the reviewer of her book refers to her by the masculine pronoun, in spite of the fact that a portion of her book originally appeared in the pages of this same journal in 1884 and 1885. Her philosophical position consists, according to her reviewer, in an attempt to draw the atomistic theory and a reformation of Kant's doctrine of the ideality of space and time into the service of a doctrine of the unity of substance, which involves a return to Spinoza.

—The most delightful autobiographies are often those of persons who have led quiet and comparatively uneventful lives. A striking illustration of this fact is furnished by the recently published 'Lebenserinnerungen' of Wilhelm Lübke (Berlin: Fontane), a volume of reminiscences extending over a period of some thirty years, and giving charming glimpses into the artistic and literary circles of Germany at a time when the fatherland was known chiefly as the home of poets and philosophers, and had not yet appeared upon the scene as a united nation and the leading political power in Europe. Lübke was born at Dortmund in Westphalia on January 17, 1826. His father was a common-school master, who rose to this position from the still lower estate of a weaver, and whose career is admirably sketched in an introductory chapter entitled "Aus dem Leben eines Volks-Schullehrers." Dortmund, whose origin is lost in legend, was a city in the days of Charlemagne; in the Middle Ages it was one of the most impregnable of fortresses (*so fast as Dürtem* became a proverb), and played an important part as a member of the Hanseatic League and the chief seat of the famous Vehmic tribunals. Its architecture, antiquities, and historical associations exerted a strong influence upon young Lübke, and turned his attention to the line of scholarly research in which he has acquired so great distinction. This tendency was developed and confirmed by his intercourse with Kinkel at Bonn and through his subsequent intimacy with Burkhard, Kugler, Schnaase, and Waagen in Berlin. There, too, he became acquainted with Friedrich Eggers, editor of the *Deutsche Kunstblatt*, in which his earliest articles were published. In 1857 he was appointed to a chair in the Berlin Academy of Architecture and in 1861 to a professorship in the Polytechnicum at Zurich. Meanwhile he had visited different parts of Germany and travelled extensively in Italy, France, Belgium, and England, and embodied the results of his studies in an outline of the history of art and two works on the history of architecture and sculpture from the earliest times to the present day, besides several monographs on kindred topics. The record of these journeys is very pleasant and instructive reading, and brings one in contact with many interesting persons. Lübke's 'Reminiscences' come down only to 1861, and comprise what might be called his *Lehrjahre* and *Wanderjahre*.

—On May 17 the Academy of Lausanne in Switzerland was christened a University, an event that was celebrated by three days of general festivity. Nevertheless the Universi y exists as yet only on paper. The Academy of Lausanne, or *Schola lausannensis*, as it was first called, was founded in 1537 by the Bernese Government in the interests of the Reformation and for the purpose of educating young men for the ministry. It was originally a mere school of theology, and retained this character essentially until 1837, when the faculties of law and of philosophy were established. During the first two centuries of its existence it did not confine itself to instruction, but exercised important administrative functions. It appointed and ordained preachers of the Gospel, and was keen-sighted in detecting the slightest aberrations from orthodoxy; it was invested with the censorship of the press, and performed the duties of this office with the severity of a Spanish inquisitor. In 1698 it put the writings of Machiavelli, Hobbes, and Spinoza on its Index prohibitory, which might now be consulted as a catalogue of the best books of that time. After its reorganization in 1837 it had seventeen professorships and an annual appropriation of 60,000 francs. It has numbered a few distinguished men among its professors, but they have been chiefly foreigners. In 1871 a Russian named Rumine died at Lausanne and bequeathed to the city 1,500,000 francs for the erection of a public building, the nature of which was to be determined by a committee consisting of five professors of the Academy and five members of the Municipal Council, who, in accordance with the will of the testator, were to meet and decide this question fifteen years after his decease. This meeting was held in 1886. The committee agreed to use the money, which had meanwhile increased to 3,000,000 francs, to construct a suitable edifice for the Academy, and to convey it to the Cantonal Government on condition that the latter should endow some additional professorships and, by virtue of a new charter, transform the Academy into a University. This metamorphosis has now been legally effected, but has produced no actual change in the character or educational equipments of the institution. The foundations of the new building have not yet been laid, and even when it is completed, the so-called University will be nothing but the old Academy more elegantly and more comfortably housed.

—An unmistakable proof of the prosperity of Egypt is the increase in the number of and attendance upon the Government schools. In 1887 there were twelve schools, with 1,919 pupils, only half of whom paid fees, to the amount of £9,000. In 1890 the schools had increased to 47, the pupils to 7,307, of whom 62 per cent. paid nearly £20,000. These results are the more satisfactory as attendance is not compulsory, and, until recently, teachers were accustomed to bribe children to come to school in order to claim the Government grant. The new Director-General of Education is Artin Pasha, who was Under-Secretary in the late Ministry of Riaz Pasha, and acquired an excellent reputation in his department; but the principal credit is due to the Chief Inspector, Mr. Douglas Dunlop, who is aided by a staff of about thirty European teachers, sixteen of whom are English. In addition to Arabic, each pupil is required to learn, at his option, either English or French, not merely as a linguistic study, but mainly as a medium of instruction. In 1889 86 per cent. of the pupils chose French, but last year the proportion fell to 77 per cent. This predominance of the French is owing to the singular fact that English is not yet recognized as one of the official languages. All the great Powers have signified their willingness to accept it as such, but France naturally interposes a hindrance. As the matter now stands, a knowledge of the French language is essential to obtain a Government position. Of the foreign schools in Egypt the French are by far the best, the chief of which, according to the London *Times's* correspondent, are the Jesuit colleges —establishments of a high order with a large attendance. There are also good Italian and German schools giving a somewhat advanced education. In the schools connected with the American missions Arabic is used as the medium of instruction. But the three or four English schools are small, and provide only an elementary education. To six Egyptians who are studying in England, there are one hundred in France, and a Government training-college exists in Cairo under French management.

WAGNER'S LETTERS TO DRESDEN FRIENDS.

Richard Wagner's Letters to Theodor Uhlig, Wilhelm Fischer, and Ferdinand Heine. Translated, with a Preface, by J. S. Shedlock. Charles Scribner's Sons. Pp. 512.

THE modern interest in personality is illustrated by the fact that some of Wagner's best essays, which have been in print three or four decades, have never been translated into English, while his letters to Liszt, with Liszt's answers, had hardly left the printer's hands before the late Dr. Hueffer set to work and produced an excellent English version. The same has been the case with the new collection of letters to Wagner's Dresden friends, the translation having been in the no less able hands of Mr. Shedlock. A comparison of the German edition with the English does not redound to the credit of the former. The eminent publishers, Breitkopf & Härtel, who have made a fortune out of Wagner's works, deemed it sufficient to place these letters in the market, with good type and paper, it is true, but without running-titles, index, or a word regarding the friends to whom Wagner addressed them. Mr. Shedlock, on the contrary, has made an excellent index for his volume, which doubles its value, and in a seven-page preface he gives such details regarding Uhlig, Fischer, and Heine as are likely to interest readers of these letters. Those who wish for further information may be referred to the *Neue Zeitschrift für Musik*, January 21, 1853, for a long obituary notice of Uhlig, and to the number for December 2, 1859, of the same periodical for a most sympathetic article by Wagner on Fischer —an article which should have been reprinted in the 'Collected Works,' because, even if it contains nothing of artistic value, it reveals the true nobility of Wagner's character, showing him in an attitude which he would probably have maintained towards all had they met him as Fischer did and as his genius deserved.

"How he took care of me!" Wagner writes in this article on Fischer. "When the utterly unexpected happened, like a miracle, and my operas, which hitherto had hardly got beyond the Dresden district, began to make their way throughout Germany, his anxiety for me gradually changed into activity, and where I, the youth, was helpless, he, the vigorous old man, took upon himself all my troubles, kept an eye on the copies and arrangements of my scores, wrote letters, made up packages, urged on some, held back others—all in order that I might live in peace and devote myself entirely to my work and my art."

It is amusing to compare Wagner's tone towards Fischer in his first letters and in some of the later ones. The first is dated 1841, begins with "Most honored sir," and ends with "Your deeply obliged servant." Wagner was in Paris at the time, but his "Rienzi" had just been accepted for performance at the Dresden opera, where Fischer was chorus-master and stage-manager, so that it was of importance to win his good will and help secure a correct performance of the opera. Wagner soon discovered that he had found not only a well-wisher, but an enthusiastic friend, in Fischer—a friend with whom he could joke and scold, and to whose sympathetic ear he could confess all his joys and sorrows, without artificial restraints. So the formal *Sie* is soon exchanged for the friendly *Du*, and the former "honored sir" is subsequently apostrophized as *Theaterjokel*, or even as a *Herrgottssakramenter!*

Similar changes are noticeable in the letters to his two other Dresden friends and coadjutors, Theodor Uhlig and Ferdinand Heine. To Heine only 26 of the 177 letters in this collection are addressed, and Mr. Shedlock surmises plausibly that many may have got lost. Heine was a comedian, a designer of costumes at the Dresden Court Theatre, and father of the Wilhelm Heine who accompanied Commodore Perry on his expedition to Japan and China, and who subsequently wrote several well-known works of travel. Ninety-two of the letters are addressed to Uhlig, who, even more than Fischer, helped the exiled Wagner in arranging his operatic and other business matters in Germany, there being hardly a letter in which some message of this sort is not involved. Uhlig was himself a composer, who, in his early youth, wrote almost a hundred vocal and instrumental pieces. He was at first an opponent of Wagner's, and even wrote a musical burlesque of his new style. He was first induced to change his mind on hearing Wagner conduct Beethoven's Ninth Symphony, and his conversion in course of time became so complete that he wrote, shortly before his death: "I sympathize with Wagner from the bottom of my heart, so thoroughly that for me the rest of the musical world, with very few exceptions, hardly exists." It may be imagined of what value such friends were to the exiled composer, who could not have ventured on German soil without risking his freedom, if not his life.

The most remarkable effect of Wagner's music on Uhlig was that it made him so dissatisfied with his own efforts at composition that he ceased from them. He tried to increase his scant income by playing in an orchestra, and Wagner playfully addresses him in one letter as a *schauspielmusikvorgeigender Mensch* — a "theatre-music-fiddling-fellow." The excellent vocal score of "Lohengrin" which Uhlig made, and which is equal to Bülow's "Tristan" and Tausig's "Meistersinger," shows what a thorough musician he was, and how useful he must have been to Wagner in attending to the alterations he made in the scores of his operas as they were produced in the German theatres. For, contrary to the general opinion, Wagner was constantly revising the scores of his earlier operas, and at one time he even entertained the project of entirely rescoring the "Flying Dutchman." In view of the superb improvements introduced in "Tannhäuser" by the Paris version, the abandonment of this plan is to be regretted.

There was another and still more important way in which Uhlig could show his friendly interest in Wagner. He wrote musical criticisms for various papers, and his pen was ever ready to fight courageously for the new cause. This partly accounts for the fact that he got the lion's share of the letters; for Wagner, at this time, felt constantly urged to give hints, both theoretical and practical, which Uhlig religiously worked up in his articles. To this circumstance these letters owe their greatest interest, for here Wagner sometimes goes to the heart of an artistic question with a directness which could hardly be expected in his more formal essays. The most radical of Uhlig's papers appeared in Brendel's *Neue Zeitschrift für Musik*, in company with similar ones in Wagner's behalf by Robert Franz, Raff, Liszt, and Bülow, who were many years ahead of the critical rabble in recognizing Wagner's genius, in confirmation of Schumann's dictum that criticism always lags behind the times unless it emanates from creative minds—which is only another way of saying that it takes genius to appreciate genius.

An interesting illustration of the way in which Wagner suggested new critical points of view to Uhlig is given in the fifty-first letter to him:

"On the occasion of the pianoforte score, I have again looked a little at the music of 'Lohengrin.' Would it not interest you, since you always write things of the kind, to discuss the thematic web, and show how the path I have struck out must lead to ever-fresh developments of form? Amongst other things, this came into my mind in the first scene of the second act. Just at the beginning of the second scene of this act—when *Elsa* steps on to the balcony—it struck me how in the prelude for wind instruments, in the seventh, eighth, and ninth bars, where *Elsa* appears by night, a theme is heard for the first time which, later on, when *Elsa* advances toward the church, in bright daylight and full splendor, is presented in complete development, broad and bright. Thereupon it became evident to me that my themes always originate coherently and with the character of plastic phenomena. Perhaps you can express this better than I."

There is such an abundance of interesting biographic and artistic matter in these letters that it is difficult to single out any one topic for special consideration. Perhaps our readers will thank us most for focussing the light that is thrown by various letters on Wagner's skill and method as a conductor, in which capacity he is less generally known than as a composer, reformer, and essayist. It is a fact that the chief difficulty against which Wagner had to contend was not that of raising the public to a higher level of understanding, but of finding

singers, players, and especially conductors who could adequately interpret his operas. Whenever they were properly performed, under his own guidance or that of Liszt or a few other competent conductors, they were received with enthusiasm, while at other places they were temporary failures. A striking instance was the performance of the "Meistersinger" overture in Leipzig under Wagner's direction, when it was encored, while the same piece, repeated some time later under another conductor at the same place, was hissed. Wagner knew very well how his operas were being butchered during the time of his exile, at most of the German opera-houses, and this kept him on live coals, and greatly added to the nervousness from which he suffered, especially as most of the first criticisms of his works were based on such wretched performances, and were, therefore, almost necessarily unfavorable. Our admiration of Wagner's personality constantly grows as we see in these letters how, although greatly in need of money for his own support and that of his (first) wife's parents, he refuses over and over again to grant permission for the performance of one of his operas to the managers of opera-houses where he knows the conditions are unfavorable. This point is very forcibly brought out in one of his letters to Heine:

"The small attention which G. paid to all my hints and directions appears to have made your hair stand on end! And yet Papa Fischer blames me so much for my guide to 'Tannhäuser'—he always imagines it to be my sole concern to see my operas performed, and that it is, *therefore*, 'unwise' to make so many out-of-the-way demands!! I have indeed good ground for shame to have been misunderstood on the most important points even by you and him. I care ABSOLUTELY NOTHING about my things BEING GIVEN; I am only anxious that they should be SO GIVEN as I intended; he who will not and cannot do that, let him leave them alone. That is my whole meaning — and has Fischer not *yet* found that out? O, you hardened sinner!!— *Na*, greet him heartily."

During his sojourn as an exile at Zürich, Wagner was constantly importuned to direct operatic or concert enterprises, and several times he allowed himself to be persuaded for a short time. In several of his letters to Uhlig he carefully describes his method, which enabled him to produce the effects that were so much admired in his performances. Before rehearsing a piece he would explain its poetic subject to the musicians to enable them to reproduce it not as one would repeat a verse in an unknown language, but as an actor speaks a line of which he fully understands the emotional import: "Most striking, in the first place, was the effect of my method upon the executants themselves; even the most ordinary dance musicians I have here in Zürich coached up to performances of which neither the public nor themselves had before the slightest anticipation." So much did the musicians like this procedure that "at the first rehearsal of the 'Tannhäuser' overture . . . the orchestra begged me to give them an explanation of the contents after the fashion of the 'Coriolan' overture, because then they would be able to 'play better.'" The audience was also provided with such an explanation on the programme, and the result is thus described by Wagner:

"The performance of the 'Tannhäuser' overture has now taken place; it surpassed all my expectations, for it really went admirably. You can best judge of this by its effect, which was *terrific*. I do not speak of the burst of applause which immediately followed it, but of the symptoms of that effect which only came gradually to my knowledge. The women, in particular, were turned inside out; the impression made on them was so strong that they had to take refuge in sobs and weeping. Even the rehearsals were crowded, and marvellous were the accounts given to me of the first effect, which expressed itself chiefly as profound sorrowfulness; only after this had found relief in tears came the agreeable feeling of the highest, exuberant joy. Certainly this effect was only made possible by my explanation of the subject-matter of the overture; but—though my own work again made a most powerful impression on me—I was quite astounded at this unusually drastic operation. . . . After what I have accomplished with it here, I begin to set some store by this piece of music. I really cannot think of any other tone-poem capable of exercising a like powerful effect on sensitive, intelligent natures. But the concert-hall is its place, and not the theatre, where it is a mere prelude to the opera. There I should propose to give only the first *tempo* of the overture; the rest—in the fortunate event of its being understood—is too much before the drama; in the opposite event, too little."

But it was not only by explaining the emotional contents of concert pieces that Wagner made his musicians so effective. Here is another glimpse of his method: "The 'Egmont' *entr' acte* I had practised with the oboist, in my own room, as if he were a solo singer; the fellow could not contain himself for joy at what he at last produced." For the performance of the "Flying Dutchman" in Zürich Wagner went so far as to complete the orchestra to the necessary dimensions by importing some musicians at his own expense. During rehearsals and performances he threw his whole soul into his work to such an extent that it took him weeks to recover. Thus after the "Dutchman" performances just referred to he wrote: "I cannot pick up again; my nerves are much relaxed, and I suffer from sleeplessness. Only once again in my life can I sacrifice myself by preparing another performance; if I ever get so far, it will be with my 'Siegfried.' Till then I must keep away altogether from undertakings of the sort, and after 'Siegfried' I shall stop." From this point of view Wagner's exile in Switzerland must doubtless be regarded as a blessing; for had he remained in the post of a German court conductor, his arduous duties would have used up all his energy, and prevented him from creating those later colossal music dramas which breathe the free and bracing air of Switzerland.

RECENT NOVELS.

In the Valley. By Harold Frederic. Charles Scribner's Sons.

Colonel Carter of Cartersville. By F. Hopkinson Smith. Boston: Houghton, Mifflin & Co.

Mine Own People. By Rudyard Kipling. U. S. Book Company.

Gallegher, and Other Stories. By Richard Harding Davis. Charles Scribner's Sons.

Stories of Old New Spain. By Thomas A. Janvier. D. Appleton & Co.

A New England Nun, and Other Stories. By Mary E. Wilkins. Harper & Brothers.

The Rudder Grangers Abroad, and Other Stories. By Frank R. Stockton. Charles Scribner's Sons.

Fourteen to One. By Elizabeth Stuart Phelps. Boston: Houghton, Mifflin & Co.

MR. HAROLD FREDERIC is to be congratulated on having worked a fresh field for a novel, and upon having made not only a new, but also a most successful venture. The story of the early Dutch settlers in the Mohawk Valley, and their part in our Revolution, has an especial interest for New Yorkers, and if Mr. Frederic had not dedicated his book to Horatio Seymour, it would have been suitable to do so to the members of the Holland Society of this city. Their Dutch blood should amble with pleasure at Maj. Dowd Mauverensen's strictures upon the "Boston talkers" who have inflated themselves into fame, and upon the English, "the blood-letting islanders" who were murdering one another by "tens of thousands all over England, nominally for a York or a Lancaster, but truly from the utter wantonness of the butcher's instinct, the while we Dutch were discovering oil-painting and perfecting the noble craft of printing with types." These are only outbursts, however, The book is a well-composed picture of Revolutionary times in the Dutch homes of the Mohawk Valley, at the Patroon's manor house in Albany, and on the field of battle among bullets and tomahawks. An excellent balance has been held between the lights and shadows of this composition, and a clever vein runs through it all of the honest Dutch Major's own personality, his fixity, his faithfulness, his round-eyed attitude towards the tangles of this mortal life. His love story is a very pretty one, and in fine it must be said that the book may boast the non-negative merit in an historic novel of being nowhere a bore.

'Colonel Carter of Cartersville' is a clever and engaging little volume, describing, with a touch both humorous and loving, an unreconstructed Virginia gentleman and the friends he endeared himself to, from his lawyer to his colored servant. We have all met many Virginia types in print, but this one has a distinct difference from the rest in that he is brought down to date and is beheld floating in rosy steam clouds of railroad schemes. The impossibility of adjusting the strait raiment of commerce to the untrammelled spirit of a Southern chevalier leads to a hundred comicalities, which are never far from the pathetic and which are excellently told.

We would not hear Mr. Rudyard Kipling's enemy say that his "own people" are orang-outangs and elephants. Yet these are among the most impressive of the group which he introduces to us as his kindred, and there is indeed a certain truth not comic herein. To Mr. Kipling not only nothing human, but nothing is alien. Since this young author first appeared, opinion about him has ranged from abhorrence to idolatry. We believe that to such as have read him most, the young luminary will most clearly appear a meteor with staying power. No doubt we hail his stories largely first for their blessed objectivity. They are really stories and not microscopy. And next, the sensation of never being kept waiting an instant for our sensation is keenly refreshing, and furnishes the leading external charm of Mr. Kipling's tales. The charm of India is indisputable also, but if there had been no India, another country would have seemed as charming. Private Mulvaney and the most winning of elephants, Moti Suj, are citizens of the world, and we shall all know them in heaven. Mr. Kipling has a few pungent words to say in autograph about his previous unauthorized American publishers; and, that nothing may be lacking to make us comfortable, there is a critical introduction by Mr. Henry James. If it be low, as Ruskin says, to run after the better expression of one's own views, let Mr. Kipling's adherents beware of this introduction. It will be only too satisfying to those base minds which delight in finding their delight set forth for them, as here, with a perfection all Mr. James's own, and with an enthusiasm which we have never known this writer previously to bestow on an Anglo-Saxon.

Mr. Davis's stories are also of the people and for the people; and their swift, concentrated style makes them grateful reading. Rarely failing in all their wide range to touch the original, they tell of types of humanity which would be recognized as familiar friends the world over. The local coloring is mainly that of New York, but coloring is subordinated to the drawing of the figures. Mr. Davis's Fifth Avenue sketches are as unaffected as those of Cherry Street, and while finding them all among the best stories of the year, we confess to a partiality for those which immortalize Van Bibber the dandy, who goes rowing in Central Park with children from the tenement-houses, and lends his aid to elopements and to deserving burglars; never, even under the most trying circumstances, losing the air of wearing an orchid in his buttonhole.

After the bee-line style of these two story-tellers, Mr. Janvier's poetic descriptions and well-ordered narrative breathe of an earlier school and takes one almost as far away in time as in place. His dark Mexicans, gentle priests, and Virgin-praying maidens are portrayed with graceful charm. If there is a slight suggestion of opera about them, it is dispelled in such of the stories as deal with the later period, when the railroad-building Americanos bore down upon the new Spain of Mexico and laid waste its fields. The mining and engineering desperado is graphically projected into the midst of the Mexican atmosphere, nor do either his manners or his morals appear to the disadvantage of the conquered race. Altogether, the author has made a new combination of figures and landscape, and has done it with sympathetic skill.

Miss Wilkins's new volume is in the vein of her earlier one, and goes far to prove it inexhaustible. The poor, dingy old New England women have lost none of their bleakness, the young ones nothing of their pathetic attempt at youth under difficulties. The kitchen operations go on as before, and over all this dismal life float rosy clouds of faith, loyalty, and heroism, without which one would feel that nothing was left but suicide. The delicacy of Miss Wilkins's hand never fails, any more than does her fertility of resource in incident. With all the monotony of entourage, a tender surprise is in every story. It is not strange that this patient monotony, these stories of self-immolation, warm the cockles of the hearts of New Englanders the world over, and prompt the feeling that martyrdom has first found its fitting garments in faded gingham.

Mr. Stockton's new book contains two delightful sea stories. Our old friends of Rudder Grange, too, are sure of a welcome from an affectionate public. Pomona's marriage has not staled her infinite variety. We cannot, however, find her visit to the Earl particularly amusing, and one or two of the stories weirdly suggest what would have happened in literature if Jacob Abbott had taken to humor.

Elizabeth Stuart Phelps's volume of stories contains some remarkable work. The sketches of clerical life bear comparison with George Eliot's on the same theme. Her war and post-war stories are also full of vitality and a throbbing energy which well suits their subject, but which in other fields not infrequently becomes a hectic flame, consuming writer and reader alike. The intensity, let it be said, never becomes morally morbid, but there is a touch of "scarlet lilies" in Miss Phelps's manner which at times threatens literary poison.

A Commentary on the Campaign and Battle of Manassas of July, 1861, together with a summary of the art of war. By Gen. G. T. Beauregard. G. P. Putnam's Sons. 12mo, pp. xiv, 187.

THIS is a continuation of the controversy over the question, Who was in responsible command on the Confederate side in the first battle of Bull Run? Like all controversies, it shows a tendency to more biting personalities as it progresses. A difference of opinion as to the relative positions of Generals Johnston and Beauregard in the first important battle of the war, was manifested in their official reports of the engagement. The subject was discussed in publications of third persons in more or less close relations to the principals, and some feeling of irritation no doubt existed between the generals themselves before they personally took up the pen. In his 'Narrative,' published in 1874, the late Gen. Johnston, in giving his reminiscences of that campaign, emphasized some facts which indicated that he did not regard himself as having abdicated any of the responsibilities or duties of the commander of the Confederate troops assembled on the battlefield behind Bull Run, but that Gen. Beauregard was, in fact as well as in theory, his subordinate. The latter replied in a paper published first in the *Century Magazine*, and which in its final shape is one of the chapters of 'Battles and Leaders of the Civil War' as published by the Century Co. To this Gen. Johnston rejoined in another chapter of the same book, and now follows the present publication by Gen. Beauregard. Former phases of the controversy were complicated by points of difference between the two generals and Jefferson Davis, but these cut no figure now.

We cannot help feeling that Gen. Beauregard has made a mistake in adding to the literature of the dispute. The facts were pretty well discussed before, and the basis for an impartial historical judgment was as well laid as it is likely to be. Anything that may seem to be gained by fuller array of testimony is likely to be offset by the ill effect of increased acerbity and the indulgence in criticisms of his opponent in which the critic seems to suffer a loss of dignity. The general reputation of two so prominent officers in the Confederate army will not be greatly changed by the debate. We think the judgment of history in the matter is likely to be adverse to any claim in behalf of Gen. Beauregard that he bore the responsibilities or exercised the powers of general-in-chief on the battle-field in question. A few undisputed facts seem to be decisive of this.

Gen. Johnston's rank was superior to that of Gen. Beauregard, and upon his joining the latter upon the 20th of July he had issued a formal order assuming command of the joint forces. He remained upon the field during the engagement, was in the mêlée in the crisis of the action, was most of the time personally accompanied by Beauregard, and no order of the latter appears to have been issued without being explicitly or implicitly approved by him. To a military critic this should seem to be enough, unless some formal and definitive declination of the command were shown. None such appears, but, on the contrary, it is impossible to read Gen. Beauregard's own story without seeing that, however Gen. Johnston may have accepted his suggestions, he did so in a way to assume as full responsibility for them, when accepted, as if he had originated them.

The Confederate army at that day had no unit of organization larger than a brigade. Beauregard had been in independent command of some of these, and Johnston of others. Beauregard had been encamped near the field of battle and had studied its topography. Johnston had come suddenly from the Shenandoah Valley and had no time to study the situation at Manassas. He accepted Beauregard's military capacity as equal to his own, and seems, in true *camaraderie*, to have tried to make the position of the second in command as useful and as honorable as he could. He accepted his suggestions of a plan of attack without any signs of jealousy or reserve, and ordered that the plan should be executed. This order was in writing. To say that a commanding general abdicates his command by ordering the execution of a detailed plan submitted by another, is a plain contradiction in terms. He demonstrates, on the other hand, that he is in command by making the order. The merit of suggestion belongs to Beauregard, the full responsibility of commanding it rests with Johnston.

Circumstances made the plan impracticable, for, on the morning of the 21st, MacDowell's army was not in the position which the plan assumed. A modification of it was submitted to Johnston, who directed that this be executed. Again he proved himself to be in command. The modification was not acted upon from failure of orders to reach the proper brigade commanders, and so Beauregard's provision as to the battle became useless through no fault of his, and his suggestions thus far had no effect but to evoke the authority of the general-in-chief as shown in the orders mentioned.

The two generals spent the morning together waiting in vain for evidence that the initiative determined on was in progress. MacDowell's attack from the direction of Sudley Springs, though distant, forced itself upon their attention. It needed no suggestion that it should be met, though the vivacity and fertility of Beauregard's brain is good guaranty that none of the phenomena of the day lacked suggestive and profitable discussion. Johnston ordered the moving of reinforcements towards the actual scene of battle, suspended other plans, and galloped to the sound of the guns. Beauregard waited only to despatch some detailed orders, and then followed his chief. Johnston personally gave fresh directions to his chief of artillery as to hurrying some batteries towards the famous hill above Young's Branch.

On the field, when the overpowered brigades of Evans, Bee, and Bonham were retreating in confusion, both Johnston and Beauregard showed the personal qualities of brilliant soldiers in rallying and reforming their broken troops. At Beauregard's earnest instance, Johnston, reluctant to part from actual contact with the fighting line, gave to his subordinate the command of the brigades actually engaged, and retired a little, to the Lewis house, to coördinate and hasten the movements on the larger field. Gen. Beauregard has injured his own case more than another could do, by repeating the assertion that in the above incident "Gen. Johnston performed, at his (B.'s) suggestion and request and at the post indicated by him, the service for which he most needed his assistance" (p. 92). That no doubt may remain that he intends to say that Gen. Johnston was acting in fact as his subordinate, he adds (p. 95), "Had Gen. Beauregard's chief of staff, Col. Jordan, been on the field with him instead of Gen. Johnston, he would have sent him to perform that same duty, as, under the circumstances, he would have ordered Gen. Johnston to it, had the latter been his junior." The impartial reader will be pretty sure to regard this as a *reductio ad absurdum*.

In his official report, Gen. Beauregard had said of this that he had secured Gen. Johnston's reluctant consent by urging that "one of us must do so, and it was *properly his place*." Treated as a loyal suggestion that the general-in-chief should withdraw from the unnecessary exposure of the fighting line to perform the more responsible duties of general direction of the army, it would be an act exciting our sympathy, as in another famous case when the line itself shouted, "Go back, General Lee!" but the chivalry and the loyalty change to blind egoism if we add, "because you are in fact my chief of staff!" There is little hazard in saying that if that explanation had been added at the time, Gen. Beauregard would have been the man to leave the front. History will be more kind to the latter than he is to himself, and will say that the gloss now given is an illusion born in later years.

The continued discussion has justified Gen. Johnston's original report as both true and generous. He treats Gen. Beauregard as his equal: he goes even beyond the necessary in attributing to him many suggestions; he gives full credit to the importance of the duty performed on the fighting line. He reserves to himself the responsibility for the actual decision as to strategy and tactics when the suggestions of the junior have been received, and this supreme duty of the general-in-chief he is shown to have exercised by Gen. Beauregard's own statements. No doubt occasions have arisen when famous officers have waived their rank and served under a junior—the instances enumerated by Gen. Beauregard illustrate this; but the rule, to which these are the exceptions, is that the ranking officer shall command. The exceptions exist only by the spontaneous act of self-abnegation of him who has the right to lead. He is the only judge of the duty or of the propriety of waiving his right. He cannot do it without knowing that he has done so, and it savors no little of the ridiculous for the subordinate to argue that it was done, while the superior both then and ever afterwards asserted the contrary, and, by the testimony of the subordinate himself, commanded the things that were actually done at each successive step in a great day of battle.

Through Russia on a Mustang. By Thomas Stevens. Cassell Publishing Co.

Mr. Stevens issues in book form the letters which he sent from Russia to the N. Y. *World* during the summer of 1890, with the addition of sixteen illustrations from photographs taken by himself. The pictures do not add greatly to the interest, since, although well chosen, they have been reproduced by a process which leaves them pale and milky in tone. The real attraction of the book lies in the author's description of his ride from Moscow to the Black Sea. The introductory chapter on St. Petersburg errs in the direction of most accounts from hasty travellers who visit foreign capitals in the "dead season," and indulge in general remarks upon the customs of all seasons, and upon classes who are absent. An instance in point is the dogmatic statement that "an American or European who visits St. Petersburg or Moscow in the winter can stand the cold better than a resident. He can stand it outdoors with thinner clothes on," etc. This hearsay evidence holds good only with regard to the first winter's residence. If the disdainful foreigner survive that, he will feel the cold much more keenly than Russians during the succeeding winters. If the author had remained a few days in St. Petersburg, he would have learned the reason for the wearing of overcoats in summer also, by cabmen and others. Equally unreliable are his statements concerning the pickles and teeth of Russian women, and a "cavalcade" of priests.

After an account of a brief trip to a village near the capital, we are introduced to his preparations for the horseback journey. In view of his frank admissions regarding the defects of the mustang which were not mentioned to him when he bought the animal from the Carver-Whitney "Wild America" show, and which he intended to conceal on selling him, his strictures on Russian horse-dealers for their grasping disposition are decidedly amusing. He secures a companion and interpreter in the person of a student from a commercial school (not a "university"—there is but one in Moscow, which is not devoid of numbered houses as stated), and sets out. The diary of his experiences, few of them startling, flows on easily and with general success except when Mr. Stevens attempts to philosophize, as on the subject of the Russian policy which is intended to keep foreign goods out of the market altogether by means of a prohibitory tariff. "Cheap clothing for the welfare of the masses is, of course, not for a moment to be considered in a country where the interests of the people are made subservient to that of the State," he writes—which may mislead some people into thinking that it is a book of American travels. The reader will find the chapter on Count Tolstoi and the account of an interview with the Governor at Ekaterinoslav the most engaging parts of the narrative; but he must be warned against accepting the Russian words used by the author as a basis for study of the language, *karpooses* for *arbuzi* (watermelons) being a fair specimen of their accuracy. One singular accusation brought against the peasants is, that they are too lazy to cook. This judgment is pronounced because they refused to cook chickens for the American, and proposed to boil eggs in the samovar. A very small amount of reflection would have shown him that it would have required hours of time and more wood than the chicken was worth to heat their oven for that purpose alone, and that eggs can easily be boiled by steam in the samovar without touching the water for the tea. Moreover, at that particular season of the year, before the new grain is harvested, the poor peasants have very little to cook or to eat for themselves.

A very great deal of the information concerning the ideas, customs, and superstitions of the people, which refers to other seasons than that at which the author's trip was made, is taken from various books. While valuable in itself, it is out of place here, to a certain degree, since it interferes with the sequence of the story, and cannot, in the nature of the case, be presented in as satisfactory a manner as in the original sources, where this whole branch of folk-lore can be studied in an exhaustive manner by such persons as affect that line of literature. Obviously, also, only the merest fraction of Mr. Stevens's information upon the Orthodox Church and the priests can be considered as obtained at first hand, and, consequently, authoritative as the record of personal investigation. With these exceptions, which the reader will readily discriminate for himself in more detail, and overlooking defects of style such as the use of "the writer" and "I" in the same sentence, we can say that Mr. Stevens has succeeded in making a very entertaining book.

Trade Unionism, New and Old. By George Howell, M.P. [Social Questions of To-day.] London: Methuen & Co. 1891.

Mr. Howell declares that this book is in no sense a reproduction of his recent work, 'The Conflicts of Capital and Labor,' or an epitome of its contents. In a narrow sense this may be true, but, with one exception, everything that is here contained may be found in the larger volume, which, moreover, seems to us to be more carefully written. The exception, however, is of so much importance as to command attention, as it treats of the rise of a new spirit among English laborers. Hitherto the aims of the trade-unions have been in the main legitimate and laudable, being chiefly the securing of liberty to combine for the support of their members while sick and out of work, and the provision of burial funds. But at the Trade Union Congress of 1890 certain resolutions were adopted which show that these aims have become subordinate to others of a widely different character.

The nature of the change will be best understood from the resolutions themselves. The first declared that as men were often thrown out of work "by the ever-changing methods of manufacture," Parliament should empower "each municipality or county council to establish workshops and factories under municipal control, where such persons shall be put to useful employment, . . . and that trade-union wages be paid." The other resolution was to the effect that Parliament should "reduce the working hours in all trades to eight per day, or to a maximum of forty-eight hours per week." The language of the bill introduced into Parliament in accordance with this resolution is noteworthy enough to be quoted. The chief provision reads as follows:

"§1. On and after the first day of January, 1892, no person shall work, or cause or suffer any other person to work, on sea or land, in any capacity, under any contract or agreement, or articles for hire of labor, or for personal service on sea or land (except in case of accident), for more than eight hours in any one day of twenty-four hours, or for more than forty-eight hours in any week."

It is not probable that Parliament will at present comply with these resolutions, but the startling feature of the situation is, that the trade-unions, if they are to enter the political arena, will hold the balance of power, and the existing parties will be tempted to bid for their votes. There is much dispute as to the number of members represented at this Congress, the official report making the number 1,800,000, which Mr. Howell would reduce by more than one-half; but at the lowest figure the total is weighty enough. Mr. Howell—to whom the resolutions are extremely offensive—endeavors to minimize the significance of this action, urging that the socialistic element brought out its full strength, while the conservative forces were without leadership. He points out also that the vote on the eight-hours resolution showed 193 in its favor, 155 opposed, and 109 abstentions. But where such a principle is involved, abstention must be considered approval.

Many of the most important unions have repudiated the action of the Congress, many were not represented at the Congress, and many will be divided. The old laborers in the cause, like Mr. Howell, are distressed by the working of the new leaven, and none of the workingmen's representatives would consent to introduce the Eight-Hours Bill in Parliament. The Socialists have not won yet, and they will meet with a stubborn opposition; but they have made such advances that the

future action of the Trade-Union Congresses will have momentous significance.

Essays on French Novelists. By George Saintsbury. Charles Scribner's Sons. 1891.

MR. SAINTSBURY collects in this volume the series of papers on French novelists contributed by him to the *Fortnightly Review* in 1878, together with a few others of different dates on the same general subjects. The essays are upon Hamilton, Le Sage, the Novel of Sensibility, Bernard, Dumas, Gautier, Sandeau, Feuillet, Flaubert, Mürger, Cherbuliez; and there is a general introductory deliverance. Mr. Saintsbury's manner of treatment is well known to our readers, but its great disadvantage of inevitable dulness is less felt in this volume than in that of the English essays lately noticed by us, because there is in the development of the French novel a story which gives some element of wider interest than belongs to the ordinary piecemeal book review in which Mr. Saintsbury delights. His knowledge of the special topic, so far as it depends on omnivorous reading of the literature involved, is thorough, and his distinctions, if they lack fineness, are as plain as the nose on a man's face. He is very blunt in speech and much given to freeing his mind; and in treating the French novel both qualities serve him well. He thinks the literary art of the French novel has been overrated, and says so; as to its superiority in "passion," he declares that "there is of passion itself more in a page, nay in a paragraph, of 'Esmond' than in all French fiction save 'Manon Lescaut,' 'La Nouvelle Héloïse,' and 'La Morte Amoureuse.'" With the complaint about "candor" he has no sympathy at all. He believes that Romanticism in some form will surely follow the present decadence of the realistic novel, and he hopes he may live long enough to read the new Scott and Dumas.

When a man professes this creed in fiction, it is plain that we have to deal with a critic and not a theorist. And in fact Mr. Saintsbury's characterization of each novelist is strong, and in our opinion his general judgments are singularly temperate and sound. The view of the French novel given by all the papers in connection is a broad and enlightening one, it is historical as well as æsthetic, and it is without that caressing touch, that finessing, that evasion of the plain truth of the matter, which has made our criticism of French literature in the current novel a literary immorality.

Elementary Science Lessons. By W. Hewitt. Longmans.

Autobiography of the Earth. By the Rev. H. N. Hutchinson. Appletons.

MR. W. HEWITT, science demonstrator for the Liverpool School Board, has drawn up a little book as an introduction to scientific studies for the youngest scholars. The physical properties of substances are chiefly considered; hard and soft, transparent and opaque, elastic and brittle bodies are all experimented upon in a simple way, and elementary generalizations are naturally reached. The scheme of the book is excellent. There can be no question that a child would be logically trained if all his studies were pursued on as logical a scheme as this; but for teachers who can really lead their classes through such a course, the book is over-minute in its instructions. Perhaps, at the outset of the introduction of scientific methods into schools of low grades, it may be necessary to show teachers of less experience how those of greater carry on the work, and thus for a time, as in the beginning of the kindergarten method, much specification may be allowed; but this stage should soon pass and leave the teachers free to invent, each for himself, the one method of the many possible methods that is best adapted to his class. The object of Hewitt's lessons is to give a knowledge of the common physical properties of matter, and to explain by means of likeness and contrast the use of these properties in classifying and identifying substances. "The children are to be told nothing which they may reasonably be expected to find out for themselves. They are rather to be brought as much as possible into the attitude of discoverers." This is excellent, and if realized will be invaluable to every scholar all through his after life; but most children will have unconsciously made many of the discoveries here set forth before they have reached the class-room. The teacher must therefore look to it that the work does not become petty and stale. It does not appear to be directly stated, but it should be understood, that such a book as this is best used simply as a guide for the teacher, not as a text for the scholars. *Their* text should be simply the materials for the experiments and the suggestions of the teacher.

If a scholar grew up on instruction of Mr. Hewitt's kind, well given, he would not, in later years, bring forth a book like Mr. Hutchinson's 'Autobiography of the Earth,' a popular account of geological history; he might, indeed, be somewhat impatient with it. The author and the book are both English, and the book contains so little that is pertinent to the geology of this country that we wonder at its republication here. It contains a straightforward account of English geology, correct as far as our knowledge of that small country goes, but hardly broad enough to deserve so large a title as the 'Autobiography of the *Earth*.' The form of statement is not calculated to inspire individual observation; there is little consideration of the evidence that leads to conclusions; geological argument is insufficiently illustrated. We question if any sportsman who, as the author supposes, might be interested in the "rock or boulder on which he rests for a mid-day repast," and who would like to understand a little of its previous history, will gain the understanding from these chapters. He may come to believe that the boulder is described somewhere in the book, but as it is not labelled, and as the book does not tell him how to identify it, he will have to remain in curious ignorance. The author does not appear to have been a teacher; he doses his readers with the information that he has gained and which they ought to wish to know, but many of the facts to which he gives much attention will never be met with by the sportsman, and the questions that the sportsman will most likely ask are not answered. It is not the kind of popular geology that we hope yet to see some day, and in this country it can have little value except to those who plan a geological walk through England. Even for these there are better books.

The Science of Fairy Tales: An Inquiry into Fairy Mythology. By E. S. Hartland, F.S.A. [Contemporary Science Series.] Scribner & Welford. 1891. 8vo, pp. viii., 365.

WHEN we consider how recently fairy tales were thought to have fulfilled their function when they had entertained for an hour the denizens of the nursery, it seems strange to find a volume devoted to them in the "Contemporary Science Series," and that there is such a thing as the science of fairy tales. It would have been very instructive had Mr. Hartland told us in a preface or opening chapter how this scientific view came to be evolved, for the present theory was not the first in the field, and something is to be said for the two others which it has displaced. Mr. Hartland, however, gives us no history of the study of fairy tales, mentions but incidentally any other theory than his own, and does not even present his own theory in an orderly and systematic manner, but allows the reader to arrange the material and draw his own general conclusions. In other words, Mr. Hartland's book is a series of studies not so much on fairy tales as on tales about fairies, which is quite a different thing, although it is justified by the sub-title of the book.

These studies (excluding two introductory chapters on "The Art of Story-Telling" and "Savage Ideas") are five in number, and deal with "Fairy Births and Human Midwives," "Robberies from Fairyland," "Changelings," "The Supernatural Lapse of Time in Fairyland," and "Swan-Maidens." All but the last deal more or less exclusively with the first of the two classes into which the author divides all fairy tales, the class of "stories which relate to definite supernatural beings or definite orders of supernatural beings, held really to exist, and the scenes of which are usually laid in some specified locality." This class the author terms *sagas* (they are really, as we have said above, stories about fairies). The last study alone deals with the fairy-tale proper, the *Märchen*, which is told simply for amusement, does not embody incidents now believed to be true, is imaginative and marvellous, unhistorical and unlocal, and ends happily.

Mr. Hartland's theory, which he propounds as the science of fairy tales, is the one now generally accepted, and which has often been examined in these columns in reviews of the different works of Mr. Andrew Lang, to whom belongs the credit of the first orderly exposition of it in recent times. It sees in popular tales the survival of savage beliefs and customs. Mr. Hartland presents it in a number of essays dealing with certain topics of fairy mythology, which are illustrated by copious references to similar beliefs, mostly among the European Aryans. The author's learning is extensive, and his manner interesting, while his inferences are generally correct. He does not, of course, pretend to be exhaustive, and sometimes overlooks an interesting illustration; as, for example, in the chapter on "Fairy Births and Human Midwives," he dwells on the curious fact that human visitors to Fairyland must not eat there, but does not cite the frequent feature in popular tales of husband forgetting bride when he partakes of food on his return home (see Köhler in 'Orient und Occident,' ii., p. 103, note to Campbell's 'Battle of the Birds,' i., p. 25, and Webster's 'Basque Legends,' p. 108). In the chapter on "Swan Maidens," p. 281, occurs an interesting example of the complex nature of folk-tales, and of the influence exerted upon them by literary or cultured sources. In an Esthonian tale cited from Jannsen, a fairy child (a nightmare) is obliged to remain with a family she has visited, and grows up and marries the son. One day in church she bursts out laughing during the sermon, and tells how she saw stretched on the wall of the church a horse-skin, on which the Evil One was writing the names of all those who slept or chattered in church, and

paid no heed to God's Word. The skin was at last full of names, and, in order to find room for more, the Devil had to pull it with his teeth, so as to stretch it further. In so doing he bumped his head against the wall and made a wry face, whereat she who saw it laughed. This is a well-known mediæval monkish legend, which was frequently told from the pulpit as an awful warning (see Crane's edition of the 'Exempla of Jacques de Vitry,' p. 100, and note p. 231).

It is to be hoped that Mr. Hartland may be induced some time to give us another and enlarged edition of his interesting work, more systematically put together and with a wider range of illustrations. The new science of folk-tales rests upon the fact of the substantial likeness of popular tales in all lands and among all peoples, which can apparently be explained only upon the theory of their survival from times of savagery, and it is particularly important to prove this by examples taken from the tales or customs of savages of the past or present.

Libelli de lite imperatorum et pontificum saeculi xi. Ex Monumentis Germaniae Historicis. Edidit Kuno Francke. Hanover: Hahn. 1891.

THE most recent addition to that vast treasury of German historical material, the 'Monumenta Germaniæ Historica,' has an especial interest as being the work of a scholar who has, since his connection with the 'Monumenta,' become one of us, Prof. Kuno Francke of Harvard University. The texts which he has prepared are four pamphlets relating to the furious conflict between Papacy and Empire in the eleventh century. They are (1) a letter of Archbishop Gebhard of Salzburg to the Bishop of Metz; (2) a letter by a certain Wenricus, a clergyman of Treves, in the name of the Bishop of Verdun, addressed to Pope Gregory VII.; (3) a long treatise by the monk Manegold of Lautenbach in reply to the letter of Wenricus, and defending the cause of the Papacy as vigorously as the former had that of the King; (4) a very short anonymous treatise 'De discordia Papæ et Regis.' Each document is preceded by a short introduction, giving an account of the manuscripts upon which the edition is based and a very brief description of the author. The edition is done with the utmost care, and is adorned with very beautiful facsimile reproductions of specimen pages from the originals.

BOOKS OF THE WEEK.

School Trustees,
Principals,
Teachers,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

The *Nation*, in its special field of political and literary criticism, is unlike any other periodical, American or foreign. At least 10,000 copies are circulated weekly, but these figures do not accurately represent the number of its readers. It is taken by reading-clubs and literary associations in a large number of places, and may be found on file in every library of importance in the country. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters.

Advertising rates, 15 cents a line each insertion, with the following discounts: 5 per cent. on four insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

Back Numbers of "The Nation."

In response to frequent inquiries from subscribers:

An incomplete set of THE NATION has little or no market value. Partial sets, bound and unbound, are always obtainable (usually lacking the earliest volumes), and do not command high rates. The bindings, generally count for nothing, owing to great diversity of styles. Volume I. has readily brought $10 and upward when complete, bound or unbound, but will bring very little in proportion if a single number is missing. Volumes II. and III. are also scarce, but not so high-priced as the first

Complete sets, both bound and unbound, have sold for $100, with tolerably quick bidders, and have an increasing value year by year.

Single numbers not more than a year old can usually be supplied by the publishers at 10 cents each. For numbers more than a year old purchasers are referred to Mr. J. W. Christopher, 47 Dey St., New York; Mr. A. S. Clark, 34 Park Row, or H. Williams, 195 West Tenth Street.

The publishers no longer undertake to buy or sell numbers or volumes more than a year old, and can only recommend sellers or purchasers to negotiate with a dealer, or to advertise in THE NATION.

[Publication was begun July 1, 1865, Vol. I. comprising the last half-year. Two volumes per year have since been issued, Vol. LI. comprising the last half-year of 1890.]

Reading Case for the Nation,

To receive the current numbers in a convenient (temporary) form. Substantially made, bound in cloth, with *The Nation* stamped on the side in gold. Holds about one volume. Papers easily and neatly adjusted. Sent, post-paid, on receipt of 75 cents.

The Nation.

NEW YORK, THURSDAY, JUNE 18, 1891.

The Week.

THE long and apologetic statement which the Comptroller of the Currency has prepared for the public as well as for the Investigating Committee, concerning his relations with the Keystone Bank, does not by any means go to the bottom of the mystery surrounding the scandal, but it does furnish a considerable amount of information which may be of service in bringing out the whole truth later. It furnishes specific dates for certain important developments in the bank's career, and it puts the responsibility for keeping the bank open for seventy-four days after its insolvent condition was known almost entirely upon the National Bank Examiner, Mr. Drew. Concerning the delay in appointing a receiver, Mr. Lacey makes a fairly satisfactory statement, saying the bank was really in Drew's hands, that the delay was not unusual, and that the situation of affairs was not changed by the delay. The astonishing feature of the statement is that both Drew and Lacey should have believed that Marsh, after having confessed that he had been forging and cheating for a series of years, could, by showing repentance and willingness to aid, be converted into an honest man and safe President of the very bank he had helped to plunder.

John Bardsley, the dishonest City Treasurer of Philadelphia, who sunk $930,000 of State funds and $600,000 of city funds in the Keystone Bank, and $200,000 of city funds in the Spring Garden Bank, has pleaded guilty to three indictments, containing seventeen separate counts, and his counsel announces that he is preparing a complete statement for him, which will be read in court when Bardsley comes before it for sentence on June 23. Whether this statement will prove to be a full confession, remains to be seen. If it does, it is safe to say it will be the most interesting document published in Philadelphia for many a day. Every day's developments about the Keystone Bank management add to the already overwhelming proof that there was extraordinary rottenness there for months before it was closed, and that a large number of people were thoroughly cognizant of the fact. The Assistant Cashier, Charles Lawrence, testified last week that as early as December 2 of last year he announced in the directors' room of the bank, in the presence of five of the directors, that the indebtedness of the bank amounted to a million dollars. He said, also, that he and the fugitive President Marsh used every effort to deceive the Bank Examiner, who was at the bank nearly every day; that Lucas, the dead President, who stole nearly a million of the bank's funds, began his thieving ten years ago, and asked Lawrence at the time to make alterations in the books to conceal it; that the amount increased steadily till it reached $300,000, and he had to conceal the loss of that sum in his ledger; that Lucas simply drew checks for what he wanted, and, as he had no money to his personal account, they were paid with the bank's money; that in all $320,000 or $330,000 of the bank's money was paid to him in this way, and either its loss was concealed on the books or the books were mutilated to prevent the Bank Examiner from discovering the loss. Lucas is the man with whom good, pious Mr. Wanamaker entered into the "blind pool" in Reading stock, and who furnished Mr. Wanamaker with 2,515 fraudulent shares of Keystone stock upon which to raise money for their joint speculation.

Is there nothing disgraceful or dishonorable in the record of Wanamaker's intimate association with two swindlers? One of them is dead and can tell no tales, like Quay's wicked partner in the Treasury thefts, and the other is a fugitive, and Wanamaker's brother is on his bail bond. Do Mr. Wanamaker's defenders really congratulate themselves that he has not broken into a bank with a crowbar? When the newspapers of Philadelphia gloss over such transactions as his, and pronounce glib confession of them complete vindication, they become a party to them, and are as culpable as he is. Mark well the fact that the newspapers which are doing this are the same ones that were advocating Delamater's election last year, and mark well, also, that no whisper of the rottenness of the Keystone Bank was allowed to get out till after Delamater's defeat. When the plan to put him in charge of the State Government had failed, and not before, Wanamaker began to get his money out of the Keystone Bank, Marsh made up his mind to confess and run away, and the Bank Examiner began to find defects in the bank's accounts which compelled him to make report of them at Washington. The press which is now endorsing Wanamaker's performances was doing its utmost to put the State Treasury behind the rotten bank, and conceal the thefts from its funds which Bardsley has been forced, through the failure of Delamater's election, to confess.

The Pennsylvania Supreme Court has decided that the Governor has the right to fill the vacancy in the City Treasurership of Philadelphia caused by Bardsley's resignation, and consequently that the office shall be occupied by the man of Mr. Pattison's choice, instead of a man elected by the distrusted City Councils. Everybody knows that the Governor will insist upon the most rigid investigation and the most thorough exposure of all the facts, while everybody suspects that the local ring would do its best to suppress the truth and prevent any further revelations. The incident furnishes fresh evidence of the great advantage to the State of Mr. Pattison's election. If the Republican Machine had made Delamater Governor, and there had been any hint of the Philadelphia bank rottenness, the whole power of the State Government would have been exerted to hush up the scandal and protect the rascals.

President Harrison has given further evidence of his unusual skill in making judicial appointments by his action in constituting the new Court of Private Land Claims. This court consists of five members, and all of the five appear to be men of excellent standing in their respective States. Better still, Mr. Harrison has recognized the proprieties by dividing the places between the two parties and the two sections, two of the five offices being given to Democrats and two of the judges being taken from the South. It is a great pleasure to be able to bestow such unqualified praise upon the President's judicial appointments. The mystery is that a man who shows such excellent judgment in this direction should be capable at the same time of appointing Tanners and Raums.

The remarkably fair Reapportionment Bill which has been so long and bitterly contested before the Massachusetts Legislature was finally passed to be enacted last week. The minority of the Republicans, who resisted the greatest pressure to change a non-partisan measure into the worst sort of a gerrymander, deserve the heartiest praise. Massachusetts is the State which gave the country the name that is now universally applied to the unfair division of a commonwealth into districts, when Elbridge Gerry pushed through his famous scheme in 1812; and it is really only doing penance for an old offence against justice when it now passes a measure that challenges the admiration of the nation for its reasonableness. The only discreditable feature of the incident is the fact that Mr. Henry Cabot Lodge, "the Scholar in Politics," used all his influence to defeat this uncommon exhibition of fair play. Only a few months ago, however, Mr. Lodge was urging that Congress should assume the power of dividing all the States of the Union into Congressional districts. The chief argument which he urged in favor of the innovation was that the Legislatures were almost certain to show partisanship in the matter and substitute reckless gerrymandering for fair districting, and that Congress was the only body which could be trusted to be sternly unpartisan in the premises. Yet after vainly urging that Congress should reapportion Massachusetts on the ground that the Massachusetts lawmakers could not be trusted to do the right thing, he returned to his State only to appear at the Capitol as a lobbyist against a measure which every-

body conceded to be strictly non-partisan, and in favor of substituting a scheme which the Republican Chairman of the Committee having the matter in charge pronounced "the most outrageous gerrymander ever proposed"!

Mr. Roosevelt has been doing excellent service in bringing the assailants of the Custom-house civil-service examinations to book, and making the Republican Association of the Twenty-third District, which has been very noisy in this field of late, prove its charges of unfairness and unpracticalness. We need hardly say that, in spite of every accommodation on Mr. Roosevelt's part, all attempts to prove the charges have failed. There never has been anything tangible behind these attacks except a general, but deeply rooted, feeling that there must be something wrong about a system which admits Democrats to office under a Republican administration. How long the party will put up with this judicial-mindedness on the part of Mr. Roosevelt remains to be seen. There is already considerable hostility to him, which is likely to grow as we get nearer to the Presidential election. Until now he has been able to repel the enemy by occasional hearty denunciation of the Mugwumps, which always soothes discontented regulars; but the effect of this will probably wear out after a while. Still, he can always make the denunciation a little stronger, which we advise him to do if it will save his influence in the party, for the influence is excellent and the Mugwumps do not mind. We wish his friend up in Massachusetts, Mr. Cabot Lodge, would follow his example, by walking in the ways of righteousness and cursing Mugwumps at the same time. Far from this, Lodge indulges in the most unholy tricks, and abuses the Mugwumps besides, which is wicked excess.

Reports from Kansas and Nebraska agree that the Alliance movement is beginning to lose strength. No less than twenty-five sub-alliances in Kansas have already repudiated the third-party action of the Cincinnati Convention. In one case, and that too in a county which has been considered a stronghold of the "People's party," a resolution was adopted unanimously declaring that, as the South was not represented in the late Cincinnati Convention, and as the third party threatens to disrupt the Republican party to the benefit of the Democratic party, "we abandon the third party to return to our past affiliations." Ex-Congressman Dorsey of Nebraska reports that in his State also the farmers are losing their interest in the Alliance. It is significant that the falling away from the Alliance accompanies a prospect of excellent crops this year. It shows that the movement of last year was largely an outbreak of discontent over the hard times caused by poor crops. It was noted last fall that in many places where the season was not a bad one, the men who made the most noise at Alliance meetings were farmers who neglected their farms, while neighbors who did not waste their time sitting about grocery stores and bewailing the outrages committed by "the Money Power" got along all right.

"Labor" has been making another of its extraordinary demands. A chief ground of offence against the Indians has always been that they were a lazy set, who would never do a stroke of work if they could help it. Of late years successful attempts have been made to educate the younger members of the race into the idea that they ought to support themselves. One of the schools maintained by the Government is situated at Genoa, Neb., and some of the Indians attending it are working in the sugar-beet fields of that State. Thereupon a meeting of "workingmen" is called which passes resolutions protesting against such industry on the part of the Indians, and petitioning the Government to prohibit it. Moreover, the politician who is Superintendent of the School is so much impressed by the importance of this demonstration by "Labor," that he recommends the Indian Commissioner to comply with the demand. The Commissioner has administered a proper rebuke to the Superintendent, but the incident must set the red men wondering what sort of a thing this civilization, of which they have heard so much, really is.

The recently formed Tax-Reform Association has set before itself an excellent work in the matter of educating the public on the subject of State taxation. This is absolutely necessary before we can have anything like real reform in our methods of raising State and municipal revenues. We notice that the chief plank in its platform is that "real estate should bear the principal burden of taxation." This is what real estate now does in this city, and we presume there would not be much difficulty in making it bear the whole municipal burden in all our large cities, because in all of them real-estate owners have something in the nature of a monopoly. But when it comes to farming lands, the problem changes. Owners of land used for agricultural purposes have no monopoly. They are exposed to keen competition in the sale of their products in nearly every State in the Union, owing to the present extraordinary and increasing cheapness of transportation. They are, therefore, not able to diffuse the taxes that fall on them in the first instance, as urban landowners are. The city real-estate owner can certainly, in most situations, insert his taxes in his rental, or in his prices of goods, but the farmer cannot so easily insert them in his cattle or grain. This is the main difficulty in the way of the Tax-Reformers, and the one to which they should address themselves most sedulously.

The severe comments of the Court of Appeals on the performances of the members of the bar who make frivolous applications for writs of habeas corpus in order to delay the execution of criminals, or, in other words, to hinder the administration of justice, will be read with much comfort by an afflicted public. The point in these remarks, however, which contains most comfort, is the suggestion that the Supreme Court should discipline the offenders. Let us hope that the Supreme Court may be induced to act on it. The theory on which the public puts up with the bar is, that the lawyers are officers of the courts and equally concerned with the judges in the proper and orderly administration of justice. To have the bar's privileges converted, as they have been in these murder cases, into weapons of opposition to the law, into instruments for making the law contemptible and securing impunity for crime, is more than any civilized community can bear very long. So we trust the Supreme Court will use any powers it possesses to fill the lives of these habeas-corpus tricksters with some kind of terror.

The Merzbacher defalcation in the New York Life Insurance Company has turned public attention to the financial management and expenses of life-insurance companies. The officers of that company seem to have involved themselves in a series of unpleasant contradictions regarding the Merzbacher matter, both as regards their responsibility to the public therefor and as to the manner in which the loss is to be made good. It is stated that the defalcation, amounting to about $370,000, can be easily made up by Merzbacher in a few years out of his commissions. This implies very large annual payments to this agent, and it is a fair question to ask whether all agents of the company are not paid proportionately large commissions. Stories have from time to time reached the public ear of large salaries to officers both high and low, of repeated gifts or bonuses to favored individuals, and in general of liberal, not to say extravagant, expenditures of the policy-holders' money in all directions. To this we may now add, it seems, enormous commissions for securing business. It is not clear where in the accounts of the New York Life, as presented to the State Superintendent, this defalcation was carried, or whether the loss was allowed for at all. Is it possible that the system of accounts demanded by the State from our life-insurance companies is really inadequate, and that the investigations are either too formal or are not made public in enough detail? For we must remember not only that honest management is necessary, but also that it is important to correct unbusinesslike methods if any exist, to the end that the policy-holders may obtain their insurance at the lowest price consistent with safety. If we assume that insurance companies are quasi-public bodies, and therefore properly subject to State inspection, it is not too much to expect that the business management as well as the safe keeping of the money held in trust should receive the attention of the State and of the public.

The Pilot Chart of the Federal Hydrographic Office for June, giving the marine record for May, has an exceptional interest for transatlantic voyagers at this period of the year, when the number of outgoing passengers to Europe and the flow of icebergs on the ocean are usually both at their height. Last year at about this time the amount of ice at or near the Grand Bank surpassed, if we are not mistaken, all previous hydrographic records. It reached eastward to long. 35° W. and southward to latitude 40° N., covering roughly an ocean area of several hundred thousand square miles. The bergs last year were not only many in number, but of uncommon size, and during April and May there were twenty-four collisions with vessels, notably those of the *Normannia* and the *Thingvalla*. So remarkable was the iceberg season of 1890 that the Hydrographic Office printed at the end of the year a set of supplementary charts to show it. This year, by contrast, the ice-flow is trifling. It reaches southward to about lat. 42° N., or two degrees north of last year's limit, while its eastward limit is some 400 miles west of last year's. It is "stringy" in shape, and its area probably less than 100,000 square miles, or a small fraction of what it was a year ago. In this month's report the keeper of the Belle Isle light-house is quoted as saying that "if there is any heavy ice to the southward off the Bank it must have passed this coast a long distance off, as only one iceberg has been seen during the entire winter"; although last year the east coast of Newfoundland, and of Labrador also, was at times almost unapproachable on account of ice.

These remarkable variations in the southward flow of arctic ice give an interest to the expedition to North Greenland on which Lieut. Peary and his party started on Saturday week. It will be remembered that the charting of the west coast of North Greenland, as seen from the elevation of the ice-cap of the western interior, is one of the objects of his novel and venturous journey. Looking off on the waters, he may also be able to determine something as to the southward movement of the bergs of the northern arctic regions and to what extent they come from upper waters hitherto unseen. Gen. Greely has asserted that a very large part of the ice-flow comes from a region above Baffin's Bay, and on this point Lieut. Peary may be able to give us new light, particularly should he be able to reach Greenland's "furthest North." Of the places of origin of the ice as a whole and the speed of its southward flow we now know positively almost nothing, the only clue to the latter being the eight months' trip on an ice floe of the wrecked party from the *Polaris*, who, after drifting from upper Baffin's Bay to Labrador, were rescued in the spring of 1873. The law of the ice flow, if once ascertained, may manifestly have a most important bearing on future arctic exploration in the selection of seasons when relatively little ice will be encountered. The unavoidable ignorance on this point has hitherto baffled many arctic explorers, and, what is much more important, reduced materially the catch of the sealers and whale-fishers.

The Prince of Wales does not seem to be nearly out of his troubles. The New York *Sun*, which seemed last week to be prepared to stand by him, abandoned him on Sunday to his fate, and the censure of the Tory press in England is even more severe than that of the Liberals. This, we suspect, is in part a bit of preparation for the general election, for the middle and working classes, not unnaturally, are always disposed to hold the Conservatives responsible for "scandals in high life," as the chief figures in them are usually members of the party. The middle and working classes, too, are now a very formidable factor in a general election, and a clean sweep of the Tory party from power, as a condoner of princely immorality, would be a very serious thing. But the party is between the devil and the deep sea, for a condemnation of the Prince of Wales is, of course, inevitably more or less of a blow to that now very sickly thing, "the monarchical principle." Any arrangement which compels people to support in luxury, at great expense, for fifty years, an idle, somewhat vicious, and by no means gifted man, in order to have an heir ready for an office which has only nominal duties, can ill bear discussion or criticism in our day. The times are wonderfully changed since Leigh Hunt was sent to jail for speaking disrespectfully of the Prince of Wales who was afterwards George IV. George IV., however, escaped one source of embarrassment which for his grandnephew is very serious. He introduced very common people into "society," but he did it because he liked them. The present Prince of Wales labors under the somewhat ludicrous imputation of undertaking it for cash, and of being importuned for the return of the money on the ground of failure to perform the contract. There is nothing like this in the history of monarchy, but it is what might have been foreseen when a commercial democracy was suddenly brought into contact with a mediæval social hierarchy.

The annual report of Sir Evelyn Baring, just presented to Parliament, though chiefly upon the finances of Egypt, contains an interesting account of the progress made during the eight years of English control in that country. In 1883 insolvency was imminent; now a financial equilibrium has been secured, the surplus of revenue over expenses for 1890 having been £600,000, while the reserve fund amounts to £1,745,000. While few direct taxes have been abolished, owing chiefly to the opposition of the French, the condition of the fellaheen has greatly improved. They are no longer subjected to the slavery of the *corvée*, that system "of forced, unpaid, and unfed labor by which the irrigation works of the country were maintained." The use of the koorbash has been prohibited, and with the lash has passed away "a whole system of brutality and physical intimidation." There has been a distinct diminution of administrative corruption, the enemy of all genuine progress in a country where hitherto bribes were unblushingly exacted by every official, high or low. A reform of the judicial system has been instituted in spite of the determined opposition of many Egyptians of the highest rank, and promises to be far-reaching in its beneficial effects. This is a record of which England may well be proud.

As might have been expected, Chancellor von Caprivi refused on Thursday to present to the Lower House of the Prussian Diet the material upon which he based his extraordinary speech of June 1st. Contrary to the general expectation that the Government would propose to the Federal Council a temporary suspension or reduction of the grain duties, Caprivi, in defiance of monster petitions pointing out the existence of actual agricultural distress, in opposition even to some of the stanchest protectionists and most devoted adherents of Bismarck's agrarian policy, such as Von Kardorff and Von Hammerstein, announced that the Government had decided to uphold the present duties. He denied that the prices of cereals were abnormally high, maintained that Austria, Russia, North America, and India were fully able to meet Germany's increased need of grain, and demonstrated, in the usual approved way, that a reduction would certainly benefit the foreign producer, while it was very doubtful whether the German consumer would profit by it. His argument culminated in the declaration that a 50 per cent. reduction in duties would in any case hardly affect the price or the weight of bread, as it would make rye only two or three pfennigs per kilogramme cheaper—a dictum which will henceforth take rank in economic discussion with Mr. Evarts's little three-cent joke. Naturally enough, Herr von Caprivi now shrinks from the consequences of his own speech, and refuses to divulge the names of the "experts" who furnished him with the data for his arguments. The vehemence with which Herr Rickert, as the spokesman of the Freisinnige party, turned in Thursday's debate against the Chancellor, and the taunt of Herr Richter that the Government withheld its documents because it was ashamed of them, must have convinced Caprivi that the policy of taking the wind out of Bismarck's sails, by temporarily adopting his economic vagaries, is not likely to prove successful. It is more than possible that the dissensions already existing in the Cabinet regarding the agricultural question will become more pronounced as the combined attacks of the National Liberals, Progressists, and Social Democrats reveal the strength of the opposition in the Reichstag to the present duties; and Herr Miquel, the Minister of Finance, in particular, who is opposed to their retention, may be compelled to withdraw in spite of William's *sic volo*.

THE CHILIAN SITUATION.

THE Chilian Congressional Junta have issued a manifesto describing the political situation in Chili as seen from their point of view. It adds nothing of much importance to the statement made some time ago in the New York *Tribune* by Don Ricardo Trumbull, the Congressional envoy now in this country. Nor, happily, do we need it in order to be able to pass judgment on the conduct of President Balmaceda. His own message to his Congress now sitting, dated April 20, contains as complete an indictment against him as his worst enemy could draw up. He admits that he had a long quarrel with the Chilian Legislature, owing to their distrust of him; that for reasons which seemed good to them they refused to support Cabinets appointed by him, and it must be remembered that Chilian Cabinets are of the French and English type, and have seats in the Chambers, and are dependent for their existence on a Parliamentary majority. He admits that Congress emphasized its disapprobation of him by refusing to make the annual appropriations for the army and navy, and he admits that when this was done, he dispersed the Congress by armed force, closed the higher courts, locked up the judges who decided against him, and proceeded to carry on the Government as a self-appointed dictator, and plunged his country into civil war.

Now this is his own story. It lies before us. We are adding nothing to it and taking nothing from it. It is on this that he must submit himself to the judgment of the civilized world, and especially to the judgment of the friends of parliamentary government. The American public certainly ought to have no difficulty in making up its mind about the rights and wrongs of the matter even on Balmaceda's showing. But it ought not to be dependent upon Balmaceda's showing, or on that of the Congressionalists either. We ought to have at this moment in Chili as our representative a first class man, known and trusted by the country, whose reports would furnish guidance both for the Administration and for public opinion. Considering the efforts we have been making of late years to acquire moral influence over the South American republics, to enter into closer commercial relations with them, and to get them to live under our hegemony as regards Europe, there is something grotesque in the fact that our representative in Chili—the chief of these republics—just now is a barely naturalized "Blaine Irishman," of whom the country had only heard as a British political refugee until he was appointed to the Chilian Mission.

We have already in these columns pointed out the parallel between the existing crisis in Chili and that which would have arisen in this country had Andrew Johnson appealed to force against Congress in 1867, as he very likely would have done had he had a regular army like that of Chili under his command. The Chilian regular army is composed of semi-civilized half-breeds or Indians, very ignorant, very obedient, and very brave—just the material, in fact, for a *coup d'état* at the hands of an unscrupulous executive. It is a great misfortune, as we all recognize here, for a parliamentary country to be obliged to keep on foot a standing army of any kind. It would hardly be tolerated in England were not so much of it needed for foreign service, and had it not been firmly placed in subordination to the civil power by a series of successful struggles with the Crown. As it is, its maintenance is dependent strictly on the annual passage of the Mutiny Act by Parliament. Did that act, for any reason, fail to pass, there would not be a lawful soldier in England the day after Parliament adjourned. We have the same rule here. Our little force would cease to exist if Congress, for any reason, made no appropriation for it.

In all constitutional countries this power of the Legislature over the army is recognized as the most important guarantee of public liberty. Considering the composition of the Chilian army, it is of more importance perhaps in Chili than in any other republic. The army there is a more dangerous weapon in the hands of the Executive than anywhere else. The Chilian Congress was, therefore, exercising a most important right when it refused to a President whom it distrusted the command of a large military or naval force, by failing to make the annual appropriations. For the American public to deny this power to the legislature of a sister republic, would be to express contempt for constitutional government. For the failure of the Chilian Congress to make such appropriations, Balmaceda was not responsible. The duty of a constitutional Executive under such circumstances is to appeal to the courts or to the voters. It is the voters who are charged with the duty of punishing a Congress which fails in its duty. The doctrine that Balamaceda enunciates, that when Congress fails to pass such acts as the Executive thinks it ought to pass, he may use the troops to disperse it, is, of course, to convert republican government into a farce.

We do not think so clear a case for American sympathy and forbearance, we will not say assistance, has arisen on this continent since the establishment of our Government. It is clearer by far than that furnished by the original revolt of the Spanish colonies against the mother country, because no man was then able to foresee what sort of political organization the success of the revolt would produce. Chili has been the best of all the governments which it did produce, the most peaceful, orderly, and free. Considering the kind of population it has had to deal with, its history has been very remarkable. This usurpation of Balmaceda's, however, is making a fearful breach in the traditions of peaceful progress. The one cheering sign in the gloom of the situation is the firm resistance with which he is meeting. Could he have successfully and quietly perpetrated his crime, it would be useless to look for constitutional government in Chili for a century to come. The country would have lived for an indefinite period under a veiled despotism like that of the Third Napoleon.

The *Tribune*, we presume under official inspiration, takes this view of the situation in Chili:

> "The appeal of the Chilian insurgents to the European Powers for recognition as belligerents is grounded upon *de facto* occupation of four provinces, the support of the navy, and the authority of the Congress elected in 1888. In reply the Balmaceda Government can make out a strong case for its own superior position and resources. It has undisputed possession of the capital and the principal port, the army has not swerved in allegiance to it, the majority of the provinces are controlled by it, and a new Congress has been brought into existence. Balmaceda's dictatorship now has legislative warrant in the action of the Congress recently elected. While he was deposed by the majority of the preceding Congress, the proceedings were irregular and did not have the validity of a constitutional impeachment. His action in prolonging the credits for the military budget which the Chambers had declined to vote was unquestionally illegal, but the new Congress has virtually condoned the offence under the plea of necessity, and armed him with supreme powers for suppressing the revolt. Strong as may be the sympathies of foreign Powers for the insurgent cause, they will hardly be justified in granting the demand for recognition of belligerent rights."

The answer to this is, that this description of the position of Balmaceda would, barring the fact that the last Congress is in the field against him, have applied exactly to Louis Napoleon's position after 1851. The trouble in all cases, since the dawn of history, in which revolutions have been made by self-constituted dictators, is that "the army did not swerve in its allegiance to them." This is what enabled Cæsar to overturn the Roman Republic, Cromwell to suppress the Long Parliament, Napoleon I. to execute the Dixhuit Brumaire, and his nephew to effect the *coup d'état* of 1851. This, too, is the reason why, as we have said, all friends of parliamentary government dread standing armies in a parliamentary country. They know that if the Executive should take it into his head to commit treason, the army would probably stand by him. The United States is therefore the last country in the world to accept from a man like Balmaceda his undisputed control of such a force as the Chilian army as an excuse for his continuing criminal resistance to the only lawfully elected Legislature of the country, and as a reason for sympathizing with him or countenancing him. It is very like accepting as a sufficient defence from a burglar the fact that he had successfully "squared" the police.

That Balmaceda has now a Congress competent to forgive his treason and arm him with legal authority to carry on the Government of the country in his own way, is equally untenable. Louis Napoleon also had a legislature after his overthrow of the French Republic, but it was not competent to pass an act of indemnity or pardon his crimes. No Congress in Chili can be a legal Congress which is elected solely in districts governed by martial law, administered by a usurper, with the courts closed and the press muzzled. It would be a crying shame and disgrace if any serious American statesman gave a moment's countenance to such a view. Everything done under, for, or by Balmaceda since he dispersed the Legislature is null and void, and can have no justification except such as force can give. What terms the Congressionalists

should offer him must of course be shaped in part by their own prospects and in part by the condition of the country. But if they can negotiate with him on equal terms, they ought not, in the interest of free government, to offer him anything but permission to go abroad after his baggage has been thoroughly searched. It will be a great misfortune if we use any influence we possess to minimize in South America the guilt of a military *coup d'état*. We owe it to the cause of good republican government all over the world to set our faces like flint against the view that a President who uses the regular army to disperse the Legislature and close the courts, deserves anything but a fair trial, and punishment neither cruel nor unusual.

GENUINE AND BOGUS BALLOT REFORM.

THE Illinois Legislature has passed a ballot-reform bill which is a desirable measure, so far as we can judge from the brief outlines of it which have been published. It will undoubtedly be signed by the Governor and become a law, raising the number of States which have such laws at present to twenty-eight. If the Pennsylvania bill receives Gov. Pattison's approval, the number will be twenty-nine, but we trust that he will refuse to sign it. If "Matt" Quay and Gov. Hill had concocted it together, it could hardly be a more thoroughly partisan measure than it is. We have obtained a copy of it, and find on examination that it is the worst bill of the kind yet passed. If it were to become a law, it would have no parallel in badness except in the New York law as it stands to-day after the amendments of the last Legislature. It requires such a large number of signatures for independent nominations, and fixes the time for filing nominations so far in advance of election—fifty-six days for regular nominations for State officers, and forty-nine for independent—as to be practically prohibitive of all third-party nominations.

Not content with these obstacles to such nominations, the framers of the bill, while making provision that regular party nominations shall be arranged in groups under the party names on the ballot, have inserted a special provision that all other nominations shall be arranged in alphabetical order under the offices for which they are nominated. The object of this unfair arrangement of the ballot is, of course, to make it very easy for the voter to find the regular tickets, and very difficult to find the independent or other third-party nominations. Another defect of the bill is the lack of any limit upon the number of ballots a voter can obtain in case he spoils a ballot in the marking of it. The ordinary limit is three. Under the Pennsylvania bill he can get as many as he desires, provided he returns each spoiled one, and by wilfully spoiling a large number a malicious voter might seriously impede the election. These are merely sample provisions of a thoroughly worthless bill.

This conduct of the Pennsylvania Republican Legislature towards ballot reform, taken in connection with that of the members of both parties in the late New York Legislature and with that of the Republicans of the late California Legislature, reveals the new line of opposition which the politicians have adopted towards the reform. Not daring longer to resist the popular demand for it, they pretend to grant it while insidiously making alterations which completely pervert it. The first point of attack was the vital one of the system, that is, the one placing independent nominations on an equal footing with those of the regular parties. This is the feature of the Australian method which has been most hateful of all to the politicians, for it deprives them of their exclusive control of the ballots and strikes a death-blow at their caucuses and primaries. In New York, California, and Pennsylvania, the attack was made in much the same manner. In California the number of signatures necessary for independent nominations was placed at 5 per cent. of the total vote, and the period for filing nominations fixed at 30 days before election. In New York, where maximum numbers and not percentages are required, the numbers were so increased as to make an aggregate of 10,000 signatures necessary to secure the nomination of a complete State ticket, and at the same time provisions were adopted which render separate independent nominations, or incomplete tickets, practically useless. In Pennsylvania the higher percentage plan was adopted, with the additional obstacles commented upon above.

It will be practically impossible under each of these three measures—treating the Pennsylvania bill as if it were a law like the other two—to get any kind of an independent ticket into the field for a State election. Prohibition and other third parties will have extreme difficulty in doing so in California and Pennsylvania, but in New York they can have a full ticket so long as they are able to poll 1 per cent. of the total vote in the preceding election. There can be no doubt that in both California and Pennsylvania the design of the law is to drive these third-party tickets out of the field. Neither can there be any doubt that in New York the design of the amendments adopted at the last session of the Legislature is to make independent nominations, including municipal-reform tickets, practically impossible. In fact, the Tammany organs are already openly chuckling over precisely this effect of the amendments, and calling attention to the "hole" in which they put reformers of all kinds. Thus ballot reform becomes the ideal system for machine politics. Under the old system the politicians had complete control of the printing and distributing of the ballots, and had to pay for the privilege. They could make the distribution of independent ballots extremely difficult, but could not absolutely prevent it. Now, under the perverted ballot-reform system of New York, California, and Pennsylvania, they can have their own ballots printed and distributed at the public expense, while all independent ballots are practically prohibited by law from getting into the polling places. It is small wonder they chuckle over such a complete perversion of the reform as this is.

Fortunately they have only three out of 29 States in which to do this chuckling. Of the 26 other States—including Illinois, whose bill is certain to be a law—24 have excellent laws, and two, New Jersey, and Connecticut, have poor ones; but neither of these two discriminates against independent nominations, their defects being in other directions. The reform has made enormous progress during the present year, for no less than fifteen legislatures have passed bills since January last, and all these, except in California and Pennsylvania, are thorough-going applications of the Australian system. The politicians have begun their trickery too late to accomplish much, but in every State in which they have succeeded with it, the task of undoing their mischief ought to be begun at once.

THE STATISTICS OF DIVORCE.

THE increasing frequency of divorce in the United States has for some time caused uneasiness among reflecting persons, and has recently been made the subject of investigation by Government. The report upon this subject made two years since by the Commissioner of Labor has just received a critical examination at the hands of Mr. W. F. Willcox of Cornell University, the results of which are published as the first number of a series of studies edited by the political-science faculty of Columbia College. These results, although principally negative in character, are worked out with much care, and are a valuable corrective to the somewhat crude and hasty generalizations of the Commissioner of Labor. In the United States, it appears, there were granted in 1885 some 23,472 divorces, a number greater than is reported from all the rest of Christendom, and probably greater than the number actually granted there. The attempt to determine the rate of increase, however, is beset with difficulties. Many records were destroyed by fire in the court-houses in Chicago and Cincinnati, and the casualties of this kind are nearly one hundred in number. The census of 1870 is admitted to be inaccurate, and that of 1890 is at least questionable. But assuming the average annual increase of population to be 2½ per cent., we find the average increase of divorces to be more than twice as great. Computing the number of married couples at about 19 per cent. of the population, there were, in 1870, 155 divorces to every 100,000 couples, and in 1880 there were 203. In 1870 about 3½ per cent. of the marriages were terminated by divorce, in 1880 about 4.8, and in 1890 probably 6.2.

When we consider the large proportion of negroes in our population, and reflect that prior to their emancipation they had little occasion for divorce proceedings, it might seem probable that the increase in the divorce-rate was due to the changed status of the blacks. Unfortunately the court records do not indicate the color of the parties to

suits; but Mr. Willcox endeavors to supply the deficiency by classifying the counties of seven fairly typical Southern States according to the proportion of negroes to whites in 1880. In all these States except Georgia, the counties with over 35 per cent. of negroes show an increase greater than the average increase of the country; while the counties having less than 17 per cent. of negroes show an increase less than the average. On the other hand, it seems that the divorce-rate is in most States less in the counties with the largest negro population than in the others. But owing to the notorious underestimate of the colored population in 1870, these calculations are of little value. The opinion is said to prevail in the Southern States that divorce there is almost confined to the negroes, an opinion corroborated by the clerks of the courts; and unless more satisfactory figures can be had than Mr. Willcox produces, this judgment must be accepted.

A further argument in support of this in some respects encouraging conclusion is to be found in the rate of increase of the several States for the decade 1870–1880. The rate for the whole country being thirty-one, it is found that nearly all the States north of Mason and Dixon's line and east of the Mississippi have a less rate than this, while North Carolina, Louisiana, Arkansas, Florida, Texas, Mississippi, Alabama, Colorado, and Dakota have rates of 100 and over, and this increase in the Southern States is, owing to the errors of the census of 1870, probably even larger. But it must not be inferred from this that the divorce-rate in the Southern States, as yet, approaches that of the Northern States. In 1870 this was, as above stated, for the United States, 155 for every 100,000 couples, a rate reached by not a single Southern State and exceeded by twenty-one Northern States. In 1880 the rate for the country had risen to 203, and four Southern States surpassed this—Missouri with 216, Texas with 263, Arkansas with 270, and Florida with 287. But this unsavory preëminence was shared with twenty-two Northern States, including all New England except Massachusetts. Among these States the rate rises from Wisconsin, with 218, to Colorado, with 781. Mr. Willcox endeavors to maintain that divorce is distributed along geographical lines, being most common on the Pacific and least common on the Atlantic. But he is obliged to make so many exceptions that the generalization has little value.

Some encouragement may perhaps be derived from the fact that the duration of marriages before divorce shows a tendency to increase, being on an average nine months greater in 1886 than in 1871. One-half of all the divorces are granted within six or seven years of the marriages. The figures yield no satisfactory answer to the question as to the comparative frequency of divorce among natives and foreigners, nor can we do more than assume from the analogy of Switzerland that divorce is four times as common among Protestants as Catholics. A childless marriage is possibly three or four times as likely to end with divorce as one which results in children. Nearly two-thirds of the divorces are granted upon the application of wives, but nothing is known as to the remarriage of divorced persons, and, so far as we can judge, all the calculations may be seriously affected by the repeated divorces sometimes procured by the same individual.

The opinion has been advanced that most divorces are obtained with a view to new marriages, and Mr. E. J. Phelps goes so far as to declare that if divorced persons were not allowed to marry, "nine-tenths, perhaps ninety-nine-hundredths, of the divorce cases would at once disappear." We are entirely without evidence upon the subject of remarriage in the United States, but M. Bertillon has examined the marriage returns of Switzerland with results which are thought by Mr. Willcox to prove that divorces are not obtained for the purpose supposed, at least to any great extent. The Swiss tables show that of 1,000 widowers marrying within ten years of their bereavement, 323 will marry in less than a year, 260 in a year, and 136 in two years. Of 1,000 divorced men, 300 will marry in less than a year, 255 in a year, and 151 in two years. Of widows the corresponding numbers are 95, 264, 152. Of divorced women, 194, 282, 166.

Mr. Willcox also calls attention to the fact that in Belgium, where the provisions of the Code Napoléon have always allowed divorce by mutual consent as well as separation, the number of both divorces and separations in 1872–81 was 24 to every 100,000 couples, while in France, where no divorce was allowed, the number of separations was 33. Furthermore, as bearing upon the contention that we should have a uniform law of divorce in the United States, Mr. Willcox remarks that the passage of such a law in Switzerland was proved by ten years' experience to have had very little effect upon the divorce-rates of the different cantons, one of them having forty-nine times as much divorce as another.

As to restraints upon divorce caused by the expense of legal proceedings, it is hardly necessary to say that the morals of the people are not likely to be improved by such means. The example of Bavaria shows that legal restraints upon improvident marriages simply multiply illegitimate births, and in general it may be said that legislation can promote morality only when it is in harmony with a substantially unanimous public opinion—which would perhaps be as effective without legislation as with it. The increase of divorces in this country is due partly to the increased resort to legal remedies of all kinds, to the general uneasiness and discontent with the existing constitution of society, to the decay in the belief in immortality and future punishment, to the great development of means of travel and the migratory habits arising therefrom, to the enlarged consciousness of their rights, begetting an increased independence of spirit, among women, and to the real increase of their independence due to new opportunities of self-support. Many a man who would have formerly remained with his wife now deserts her because the railroads enable him to remove himself thousands of miles before his absence will be noticed. Many a woman who would have clung to a worthless husband from dread of starvation did she leave him, now reasons that she can make a better living by freeing herself from a tiresome encumbrance and going to work in a shop or factory.

Mr. Willcox argues forcibly that divorce laws can hardly be expected to control such tendencies as these, but he has little to suggest by way of remedy except education and change of heart. So long as public opinion is indifferent to the prevalence of divorce, it will continue to prevail and to increase.

THE SALON IN THE CHAMPS-ÉLYSÉES.

PARIS, May, 1891.

WHATEVER innovations are made in the art world of England, no matter how many the Grosvenor Galleries and New English Art Clubs formed by rebellious factions, the Royal Academy goes on in its old way, unmoved and indifferent. But it is another thing in Paris. There it was only last year that the Société Nationale des Beaux-Arts, exhibiting in the Champ de Mars, was the result of a schism in the Société des Artistes Français, but already the new exhibition has had its influence on the old Salon. The difference in the management of this year's show in the Palais de l'Industrie is marked. There has been a decrease of almost 800 in the number of pictures, of more than 900 in the sculptures accepted. The large hallway, as you go up stairs from the main entrance, is decorated with tapestries instead of the usual canvases; several of the galleries are closed altogether, in others the paintings hang but two deep, while one room, as at the Palais des Beaux-Arts, has been set aside for a Salon de Repos, where there are many easy chairs and tables covered with books and papers. In fully one-half the balcony absolutely nothing is to be seen.

This change is a decided improvement for the visitor, but it has caused much ill-feeling among the artists who have found themselves rejected from both salons. The immediate consequence is the formation of still a third association, the Société du Palais des Arts Libéraux, which will hold its exhibition in June. The malcontents are contending that when once a man has become a member of the Société des Artistes Français (and a four-years' exhibition in the Salon they think should entitle to membership), he must always be allowed to show at least one picture. Every one who has been in London and seen the atrocities on the line at Burlington House knows what this would lead to. It is just such a claim that is now recognized to be the worst form of corruption in the corrupt Royal Academy.

But many as are the modifications in the management of the show in the Palais de l'Industrie, there is none in the character of the canvases exhibited. All that is most alive, most modern, most original in contemporary art was last year carried off to the Champ de Mars and has remained there. Academic conventionality is the order of the day in the Champs-Élysées. It is true that, coming straight from the London exhibitions, the average attained seems remarkably high. Good drawing and technical knowledge are the rule and not the exception. The amateur does not prevail. But above the general average few rise to sound draughtsmanship and technique, few add that individuality, that vitality which

alone can give style and distinction to the artist's work. If for English shows pictures are produced to suit the British public, for the old Salon they are painted to appeal to the jury who award the medals, and not to record the painter's impressions or to express his own conception of the beauty of color and form. The influence of the jury, therefore, is that which is most keenly felt; the Salon in the Champs-Élysées has no place for men who have something new to say or a new way in which to say it.

The enormous canvases, never seen anywhere else, are typical examples of Salon aims and methods. This year the most conspicuous are "La Mort de Babylone," by M. Rochegrosse, a "Mort de Sardanapale," by M. Louis Chalon, M. J. P. Laurens's "La Vcûte d'Acier," and M. Henri Martin's "Chacun sa Chimère," of which French papers and critics have had much to say. I know of not a single Englishman who has the artistic knowledge or power to produce one of these compositions. But they are either cold and colorless in their academic correctness, or in them the finer artistic qualities are sacrificed to size and theatrical effect. The most striking pictures in the exhibition, they are not truly decorative or pictorial—despite their lavish display of well-drawn figures—as are the large, stately palaces and groups of Veronese, or even the coarse splendor of Rubens, though Laurens's "Vcûte d'Acier" has been done expressly to decorate the Paris Hôtel de Ville for which so many leading French artists are now working. Really better are paintings like M. Micheléna's "Penthésilée" and M. Checa's "Attila" (Checa, however, has been seen to far greater advantage), in which the painter has succeeded in suggesting, with tremendous vigor, the action and movement he was striving for; or like M. Gervais's "Les Saintes Maries," with the lagunes of Provence, their intense brilliancy and hot distances rendered so truthfully that they help one to forget that the three naked women in the foreground, whom M. Gervais, for the sake of a title, calls the three saints of the Provençal legend, are but the merest academical studies.

No less academic or official is the interest attached to the work of those painters of established reputation who have remained faithful to the Société des Artistes Français. Seldom has M. Bonnat's draughtmanship been more masterly than in his young, muscular Samson struggling with the lion. Seldom has M. Henner's strange, unwholesome color-scheme been more powerful than in his "Christ Mort" and "Madeleine." But in each it is academical rather than artistic accomplishment which the painter displays; there may be less learning of the schools in one of M. Degas's little naked washerwomen, or M. Besnard's marvellous color arrangements, but there is more art. Mere learning becomes absolutely tedious when it finds expression in the empty pretentiousness of M. Bouguereau or the inevitable lion and desert of M. Gérôme, on the one hand, or in too obvious story-telling on the other, as in "Le Pardon de Kergoat," by M. Jules Breton, with all the detail of figures and costumes aggressively prominent; or the frigidly composed "Fin d'un Roman," by M. Luminais; or Munkácsy's "Lair Favori," its composition and grouping equally aggressive, while it is without that richness and depth of color which so often distinguishes his canvases. Anecdote, usually supposed to be the special property of the British artist, has always held a prominent place in the Salon. But the Frenchman knows how to tell his story in paint better and with more feeling for the medium used in the telling than the Englishman. If he understands his trade at all, he does not degenerate into painted photography, the snare which this year in England seems to have entrapped the Newlyn men. There are painted photographs on the walls of the Palais de l'Industrie, but they have not been sent by men of standing in the artistic world. If one takes a picture like "À l'Asile de Nuit," by M. Geoffroi, with every figure unmistakably a study from life, or a charity school by Mr. Walter Gay, or a very clever milliner's workroom by the Italian Menta, and compares it with Mr. Stanhope Forbes's "Salvation Army" in the Royal Academy (of which I spoke in a recent letter), the entire group arranged as if for the camera, then the difference of treatment is at once appreciated. But though the French artist at the Champs-Élysées is more convincing, he still, as a rule, makes his story of greater importance than its artistic expression; and once the literary, or whatever you may choose to call it, meaning of a picture overshadows its merely sensuous beauty, its value artistically is lessened.

Men like Manet and M. Boldini, M. Roll and Mr. Sargent have so accustomed us to look for a new artistic experiment—the setting forth of a new artistic problem—in every portrait painted, that the old-fashioned conventional portrait now seems dull and tiresome beyond measure. Unfortunately, this old-fashioned convention has not been outgrown by the "Artistes Français," who still paint their sitters as if light and atmosphere were not, and as if to show men and women in natural positions or in their ordinary surroundings were the unpardonable sin in art. M. Benjamin-Constant would be quite at home in Burlington House. M. Munkácsy's drawing-room background is vulgar in its elaboration of elegance. M. Bonnat can hardly be equalled in the rendering of gorgeous millinery, but this is not the one end of the portrait-painter. Better far is a very curious group of a provincial municipal council by M. E. Buland, unpleasant as are its shortcomings. It is hard, and that the men are all sitting for their portraits is too evident. But the character in the faces of the Mayor at the head of the table, of the officials around it, of the gendarmes in full uniform, and the careful but unobtrusive accessories—the printed announcements, the flag, the eagle—are not only delightfully but most artistically rendered; while the chances are, that, toned down by time, the picture as a whole will lose much of its present hardness. It is worth pointing out that two of the other most notable portraits come from Great Britain. They are both by Mr. Guthrie, the young Scotch artist who has lately been so prominent in English galleries, and one in particular, of a man on horseback, gives with success the very essential atmospheric qualities so little understood by the average Salon portrait-painter; but the absence of light in the picture makes it seem likely that much of it was painted in the studio.

In landscape the Champs-Élysées Salon makes a braver showing. The influence of Claude Monet is apparent, though, of course, it is in the rival exhibition that the newest "open-air" theories and experiments will be found. Strangely enough, this influence extends to the technique of men who are quite out of sympathy with his aims and objects, and shows itself in a disagreeable, spotty method of work prevalent this year, and seen even in the canvases of M. Bonnat. Treatment which with M. Monet has the greatest breadth, with his imitators who do not understand him degenerates into mere niggling. The art of landscape-painting has been so entirely revolutionized by Monet that the work of some of its most eminent exponents, who have not fallen under the charm, would seem to belong to the galleries of the Louvre rather than to contemporary exhibitions. Contrast with more modern methods, however, cannot destroy the classical beauty of the landscapes of M. Français, nor the Corot-like grace of those of M. Harpignies, and both these men have been steadfast in their allegiance to the older society. M. Jules Dupré is also here, and, true to his name, he looks at nature through the eyes of the Romanticists of 1830, giving a quality to his painting which makes it stand out with no small distinction from the work which surrounds it. But M. Nozal, who likewise has not been tempted away to the rival camp, is far more modern in feeling and treatment, and his fine effects of frost and clouds are among the most distinguished canvases in the Champs-Élysées. Perhaps of all the followers of Monet who are here, no one has so well mastered the leader's teachings and developed a style entirely his own as M. E. Baillet, whose September Morning, with its delicate and true study of mist and sunshine, would be a masterpiece in any show. In the rendering of values, Mr. Bisbing, in a study of calves, is particularly successful. And a little group of men who live and paint at Étapes, a fishing village near Boulogne, bid fair to develop a school and a style of their own. It would be as useless as tedious, however, to keep on cataloguing the good landscapes. Moreover, far more important than the merit of individual examples is the fact, proved by the general excellence, that it is in this branch that French art is most healthy and vigorous, not even the paralyzing atmosphere of conservative headquarters stifling its strong vitality.

I wish that as much could be said for the water colors and pastels. In the galleries devoted to them the show is most deplorably dull. Work that depends for effect upon its freshness and "go" and directness is hopelessly perfunctory and lifeless and formal. It is clear at a glance that the pastellists and aquarellists of vigorous talent must have emigrated to the Champ de Mars. Here and there, rare exceptions do but emphasize the prevailing dulness. There is plenty of "go" in M. Ochoa's pastel portraits, with Parisian streets for backgrounds, of crispness in M. Vauthier's pastels of snow and sunlight on the Seine, of directness in M. Reyzner's pastel study of an old woman. Two Americans help to redeem the collection: Mr. Rolshoven in a pastel, a decorative arrangement of a woman, foliage, and sunlight (though he has another, a nude, so uninteresting that it might better have stayed in his studio), and Mr. John Fraser, in a water color, an impression of a strong cloud effect in the Highlands. But all the rest is weariness to the flesh.

Matters are not much better in the black-and-white rooms, though wood-engraving, in which the French excel, as usual, holds its own. M. Baude, M. Florian, and M. Leluc are once again to the fore with examples of technical supremacy. I learned that M. de Mare, in his etchings of bronzes for the Collection Spitzer, rivals Jacquemart very closely; and I was also struck with some very clever sketches on copper by M. Ardail, and two little plates by Mr. J. D. Watson. The Shakspere etching, published in New York, I believe, by Mr. Frederick Keppel, is here, and so is M. Flameng's etching of the Aldine Press for the Grolier Club. But of original drawings, in pen and ink or wash or charcoal, I

saw none of the least importance or cleverness, though it was funny to find as strong an illustrator as M. Jeanniot trying to do the Cruikshank act in a series of illustrations for a French book.

Little more can be said for the sculpture. But here again the high average of the French artist is very striking to any one just come from the English galleries. There are rows and rows of busts and statuettes of equal and genuine merit, good in their expression of character and in the knowledge revealed in the modelling. M. Ringel d'Ilzach himself is not represented—he having transferred his allegiance to the Champ de Mars—but the little medallions in low relief which his name suggests, are not only many, but of much artistic excellence. In the more ambitious work, in the larger statues, there is the same general high level, the same absence of any very strikingly original examples, though M. Falguières and M. Mercié, it must be admitted, are unusually good—the former in a new Diana, nude and standing, the latter in a delightful female figure, sitting and draped, with a little satyr at her side.

Technical excellence there is in abundance in the Champs-Élysées; for artistic individuality one must go to the Champ de Mars. N. N.

ROUMANILLE AND THE FÉLIBRES.

LONDON, June 2, 1891.

ON the 24th of May Joseph Roumanille, the father of the Provençal *félibres*, died in Avignon. Twenty or thirty years ago the announcement of his death would have made a much greater stir in the literary world of France. When Mistral's 'Mirèio' first took that world by storm, the little group of poets and prose-writers who, far away in the Bouches-du-Rhône, were ambitiously striving to revive the language of the Troubadours, became for the time the literary lions of the day. They were, however, but modest lions at the best. They lived far from Paris. Their work was steeped in the colors of the human life they knew and loved—the simple outdoor life of a people at once vigorous and childlike. In their verse was all the sweetness of the thyme-scented hills and the olive-grown valleys of Provence, the freshness of the harvest, the gayety of the vintage. It was like a whiff of pure country air after the heavily laden atmosphere breathed in the 'Fleurs du Mal' of Baudelaire or the 'Comédie Humaine' of Balzac. But as no rural charm could long keep M. Coquelin's *Parisien* from his beloved boulevards, so the naïve tales of Roumanille, the pastoral romance of Mistral, had but little chance when pitted against the naturalist's novel, the *décadent* poem. The new schools that were being formed in Paris offered far greater attractions to the modern man who exists on excitement. With the De Goncourts and Zola giving their pitiless studies of human evil and human wrong, with Catulle Mendès and Huysmans analyzing disease in its grimmest moral forms, with Verlaine and Rimbaud acting on life's stage their own dark tragedy, only the few had time to remember the *félibres* working and singing in the clear hot sunshine of the South.

But in the future, in the annals of French literature, the Provençal revival will hold very much the place of the Brook Farm experiment in the social history of the United States. It may not have had the influence its founders hoped for it, but its results have been very widely felt. To have originated this movement is the one great incident in Roumanille's life, which, in every other way, seems to have been as peaceful and uneventful as that of any little bourgeois in a French provincial town. He was born in 1818 in Saint-Remy, and came very young to Avignon. At one time he was on the staff of the *Commune*, the first of all the papers sold for a sou. And for many years, and until his death, as visitors to Avignon know, he was publisher and bookseller in the Rue Saint-Agricol. It was in his own shop that I first saw him a few years ago, a hearty old man, speaking French with the slow, gentle drawl of the true Provençal. There was nothing that pleased him better than to have a customer who came to buy the Provençal books of which he of course was the publisher, and, thanks to him, I found in his shop many whose names even I had not known before. His days were thus spent between writing his own books and selling those of other men—a striking contrast to the feverish, artificial existence of the Paris man of letters.

It is said that Roumanille's desire to have his old mother read his stories first led him to print these in his native Provençal. The origin of his wider ambition is less definitely known; to him, a genuine son of the Midi, it probably "came" as belief in his three-fingered flute did to Daudet's *Tambourinaire*. However this may have been, he very quickly gathered about him a band of young enthusiasts, all the sons of peasants even as he was: the people were to be the saviours of the people, as Lamartine said. And all were equally eager to do again in this prosaic nineteenth century what the Troubadours of old had done for the popular language of their day. The Midi would once more go forth and conquer France. To accomplish this great end, they met at Fontségugne one day in 1854, and solemnly formed the association known as the Félibrige. They were very much in earnest, these young men who called themselves *félibres*—why, no one exactly knew. Aubanel, with all the delicious exaggeration of the Méridional, could even foresee and warn the French Academy of the age to come, when "Sachez que vous serez tombés longtemps alors que le Provençal, toujours jeune, parlera encore de vous avec pitié." Their literary aspirations became a religion to them, their little association a church. They had all the consciousness of the importance of their mission of the London Socialist or Ibsenite, but with it they combined qualifications rarer in the self-appointed missionary—ability and good work.

Fortunately they were not unwilling to talk about themselves, nor have several of their admirers been more silent. Consequently, though of all save Mistral we know little individually, of them collectively we seem to have learned a great deal. Mistral gives us the names of the first *félibres*—the high priests, as it were, of the little church—in the sixth canto of 'Mirèio.' But it is perhaps Daudet who lets us have the most intimate glimpse into the daily life of those men together, who tells us how they met and worked and played in their less formal seasons—Daudet, who has since lost favor in their sight, and towards whom, in his home in Paris, they probably, like the men of Tarascon, would be ready to shake their fists with the same cry of rage, "Oh! ce Daudet." It is in the delightful account of how he came to write the 'Lettres de mon Moulin,' that his reminiscences of the early fervent days of the Félibrige, when there were no schisms or dissensions in the church, are to be found. It is there he records the meetings in Maillane, Mistral's village; in the Alyscamps at Arles, where, to the music of the crickets and the shrieking of the engines, Aubanel read some fine poem or drama; in Les Baux, through whose strange, broken streets they wandered singing their songs; in Avignon or in l'Île de la Barthélasse, under the shadow of the great Papal palace. One feels as if one too had been in the rooms of Mathieu at Châteauneuf-des-Papes on the occasion of the chariot race in July, drinking the famous golden wine of the popes and listening to the verses of Mistral; or at those *ferrades* where the peasants applauded the work of Roumanille and Aubanel and joined in the chorus of the hymns to the sun—"Grand Soleil de la Provence"—and then in a long line, the *félibres* leading, danced many a gay *farandole*. In the contrast between their haunts and amusements and the cafés in the Latin Quarter, the balls in Montmartre *brasseries*, the resorts of a Mendès or a Huysmans, we have the simple explanation of the difference between the work of the *félibres* and that of the *décadents*.

These meetings, these wanderings were for themselves and their own beloved people. For the instruction of the world at large they published the *Armana Prouvençau*, and that all the world might read it they began their most serious undertaking, the 'Dictionary of the Langue d'Oc,' which—perhaps because their ardor has cooled, perhaps because the task was too herculean—still awaits completion. For the public encouragement of their great work of reform, they instituted their poetic tournament, not unlike the famous *Jeux Floraux* of Clémence Isaure in Toulouse; and it was not long before they met with their first success and recognition. Mistral's 'Mirèio,' with his own French translation, was the first of their productions to make the literary sensation which they believed to be their due. Thanks to Lamartine, to whom he had dedicated it, and to Saint-René Taillandier, who wrote a paper about it for the *Revue des Deux Mondes*, it was much talked about and widely read, and France awoke to the knowledge of the truly romantic movement which had been inaugurated in her southern provinces. But the book which followed 'Mirèio' scarcely equalled it in broad human interest; much of it was either not translated at all, or else done into indifferent French. Not very long after, Zola and Daudet began to publish their stories of Provençal life in the languages, not merely of a few Departments, but of all France; and the Rougons and Macquarts of Plassans, Numa Roumestan of Aps, quickly became more popular than the Nerto or Mirèio of Mistral. Gradually the *félibres* faded out of sight again, and, indeed, but for Daudet, would have been almost forgotten except by a very small saving remnant.

But while few have remembered the leaders of the great movement, that movement has brought Provence into a prominence and given it a name which it has hardly enjoyed since the days of King René. Many have hurried to reap a harvest for themselves in the field where Roumanille and Aubanel and Mistral had sowed good seed. Every year now the *félibres* and the *cigales* of the Midi have their Congress in the towns of Languedoc or Provence. Last summer I was in Toulouse when they met, and went wandering from Auch to Agen and Lourdes and the Pyrenees. I had intended to be present at some of their reunions when poems in the Langue d'Oc were read, and the prospects of the language of the Troubadours discussed. But I found that none of the original *félibres* were there, while the most conspicuous men were the journalists who, in *chapeaux calicots*, had come down from Paris to report the proceedings. This

summer they are going to Nîmes and Arles, Martigues, that enchanting little Venice of Provence, and Saint-Chamas, where the *joûtes* are held on the Étang de Berre; and when I was last in those towns, the people were already looking forward to their coming. Of late years Provence has been made a favorite background for the scenes of the French novelist, and we have, not only Daudet and Zola, but Jean Aicard and Paul Arène and Paul Mariéton and many another lesser light adding to the long list of Provençal tales. With Englishmen and Americans also Provence is now the fashion, and they, too, are exploiting it for literary purposes. The artist as well is abroad in that fair southern land. I found an entire colony in Martigues, which is as much of a painter's camp as Étapes or Concarneau. The Salons in Paris this year attest to the artistic popularity of that country. At the Champ de Mars is Montenard, with his Arlesian arena and Provençal olive orchards. At the Champs-Elysées Martigues bids fair to rival Venice as a favorite subject, while the big canvas of Gervais—one of the Martigues group—which won him a second medal, shows the three Maries of the old Provençal legend against a broad Martigan background; and another painter has sought inspiration in the story of Ourrias, Mirèio's rejected lover.

With the founder of the Félibrige it fared still more strangely. But for Roumanille, the *félibres* would not have existed, and yet he never achieved the personal success of Mistral, and until the end he remained virtually unknown. It certainly can be no exaggeration to say that for the hundred who have read 'Mirèio,' there is but one reader of Roumanille's delightful tales. The reason for this is not in the quality of his work; not Daudet himself has written anything with greater charm, greater simplicity than 'Li Conte Prouvençau.' Indeed, one of Daudet's most artistic successes, 'Le Curé de Cucugnan,' is a translation from one of these very tales, and to many of the others he is only in a lesser degree indebted—how much, you may find out from the people *là-bas*. The spirit of 'Les Lettres de mon Moulin,' and 'Les Contes de Lundi' breathes through them all, and in one irresistible story—too long to give here—of a man of Tarascon in the Court of Heaven, we seem to have the germ from which the great Tartarin trilogy sprang. Roumanille's verse, too, has much lyrical sweetness, and is as rhythmical and full of local color as Mistral's. But a large portion of his prose and poetry alike has never been translated into French, and even to the Frenchman Provençal is as essentially a foreign language as Italian or Spanish. I have known men from the North who have lived in Arles for several years, and who even now can use only the easiest every-day phrases. I am fairly familiar with French, and yet last summer, when, day after day, on the Rialto of Martigues I listened to the fishermen talking as they unloaded their night's haul or stood throwing their *fischuaro*, or fish-rake, with which the Martigan fishes while on shore, for all I could understand they might as well have been speaking the Greek of the first settlers of their Mediterranean coast. The consequence is that while the *gardian* of the Camargue or the vintager of La Cran may understand and appreciate Roumanille's songs and tales, to the cultivated and educated Frenchman they are simply unintelligible. And again, when he has been translated, he has only in one or two rare instances been very happy in his translators. His own French is without the rude force of Mistral's; he has but once had a Daudet to do him justice.

It is but right to say that my attention—and the same, of course, is true of all Americans—was turned to Provence and its poets and its people by Miss Harriet Waters Preston's admirable translation of 'Mirèio.' To her belongs the credit of having discovered the most beautiful, the most characteristic, the most interesting part of that really unknown country—France.

ELIZABETH ROBINS PENNELL.

DEMOCRATIC ASSUMPTIONS.—III.

LIBERTY.

LONDON, May 30, 1891.

WHAT is the true relation between democracy and individual liberty?

The older democrats believed, with undoubted sincerity, that the supremacy of the people secured the existence of individual freedom. This was a conclusion in which Continental democrats who were disciples of Rousseau, and English Radicals who were followers of Bentham, though arguing from different premises, practically agreed. From the outbreak of the French Revolution to the day when Tocqueville gave currency to ideas summed up in the expression the "tyranny of the majority," no sincere Liberal doubted that, in the main, popular government meant the prevalence of liberty. This belief, moreover, in common with all the prominent articles of the democratic faith, was supported by obvious and important facts. The movement which throughout the civilized world has established the rule of numbers, delivered whole classes of men and women from the particular kind of oppression which existed more or less in every European State, whatever its form of constitution, till towards the end of the seventeenth century, and throughout the European Continent till a later date. There is now to be found no civilized country (unless it be Russia) where a private person is not better secured from unjust imprisonment and other forms of arbitrary tyranny than before 1789 were the inhabitants of any of the leading countries of Europe except Great Britain. Certain forms of expression have, it should be noted, ceased to exist. Religious persecution is unknown. It were impossible to find anywhere any system resembling arrest by *lettres de cachet*. The meanest and most scurrilous penny-a-liner is safe from the outrages and insults which fell upon or threatened Voltaire when he ruled the undisputed head of the Republic of Letters. A host, moreover, of monopolies, of privileges, or of exemptions, which a hundred years ago benefited, in every country throughout the world, one part of the people at the expense of the rest, have vanished even from memory; yet social and political inequalities which are now forgotten embittered the daily lives of thousands far more than striking and outrageous acts of oppression. If any one wishes to see the *ancien régime* in all its hatefulness, he should study it not in France, but at Bern or Venice.

Nor is the only connection between democracy and freedom to be found in the fact that the uprising of the oppressed led, from the nature of things, to the destruction of oppression. A matter of far greater importance is that the democratic movement was originally imbued with a spirit of liberty. Change is the condition of life, and innovations which in their very essence involved change filled the world with a new sense of hopefulness, of strength, of a free and renovated vitality. No doubt the Revolutionists of France were many of them among the most detestable and despicable tyrants that the world has seen. Some of them held theories which led directly to despotism. But the admission that this was so is not really inconsistent with the assertion that the democrats of a century or sixty years ago heartily desired, according to their lights—often very imperfect lights—to promote the freedom of individuals. "Civil and religious liberty" was the watchword of the English Whigs and Radicals, and it was in its day no idle cry. If the words have grown a little out of date, the main reason is that civil oppression and religious persecution (on the part, at any rate, of governments) have come nearly to an end. There existed, in short, till comparatively recent times, a real and unmistakable connection between the democratic movement and liberty in the sense in which the word is used by such a writer as John Mill—that is to say, as meaning the power of each individual to regulate all matters of conduct which primarily concern himself according to his own judgment or fancy without the restraint of legal or social compulsion or control.

The proof of this may be found in the attitude of Carlyle. His objection to democracy is, that the kind of liberty which Mill held to be the greatest of blessings, was at bottom a curse to mankind. Carlyle never contended that democracy failed to encourage individual freedom; what he did contend was that individual freedom means moral and intellectual anarchy. As, moreover, I have again and again insisted throughout these letters, public opinion is influenced far more by obvious facts and appearances than by argument. Democratic countries, such as the United States, England, or France, have long been the countries where each man could, apparently at least, most freely obey the dictates of his conscience, of his private judgment, or of his caprice. For most men this was enough to establish the fact that democracy fosters liberty.

It was, it may be suspected, rather the influence of phenomena to be observed in the United States forty or fifty years ago than any abstract argument which, for the first time, shook the faith of modern Liberals in the necessary connection between popular government and individual freedom of thought and action. It were hard to imagine two books more unlike than 'Democracy in America' and 'Martin Chuzzlewit.' The works stand as far apart as their authors. Tocqueville and Dickens have nothing in common except the one fact that they were both men of genius. But, for all that, the Frenchman's analysis of democratic society, and Dickens's picture (or caricature) of social life in the United States, are the record of a special phase of opinion. The French publicist and the English satirist each show in their writings what now seems simple-minded surprise at finding that a commonwealth might be very democratic, and yet public opinion might in the same commonwealth be neither very enlightened nor very tolerant. The Englishman and the Frenchman alike pressed upon the attention of the European world the new idea that the tyranny of kings or oligarchies might possibly be succeeded by the tyranny of numbers. Every educated man who has noted changes of sentiment, and whose memory can stretch back thirty or forty years, can recall the immense influence which this dread of the despotism of the majority exercised on thinkers in England, if not throughout Europe. The attraction for men like Mill and Greg of the late Thomas Hare's scheme and other plans for the representation of minorities, lay in the belief that these somewhat mechanical devices were inventions which made it possible for thought-

ful Liberals to combine unshaken faith in democracy with strenuous opposition to the tyranny of public opinion. What may be the merits of these inventions, it is not my purpose to discuss. They are referred to here only as a sign of the new dread of the oppression to be feared from majorities.

A candid critic, however, must admit that, as contended by Mr. Bryce, in his 'American Commonwealth,' the charge that, in the United States at any rate, the majority tyrannizes over the minority, has not been established. Many of the phenomena which originally suggested or justified the accusation were connected with the existence of slavery; and negro slavery, which was never a natural outgrowth of democracy, might corrupt free institutions, but could not exemplify the inherent vices of popular government. Experience also has proved that American democracy had the strength to cast off, so to speak, a disease which threatened the very existence of the nation. It may, further, be doubted whether the school of thinkers of whom John Mill was at one time the acknowledged representative, did not, in their attacks upon the alleged despotism of majorities, confound the uniformity with the tyranny of public opinion. They, in words, maintained that the rule of number led, or might lead, to the suppression of freedom of thought or of discussion. Their real, though unexpressed, complaint was, that freedom to think does not of itself and of necessity produce originality in thinking. The complaint may be more well grounded than men are generally aware; but it is a different thing from a charge of oppression. However this may be, one thing is certain: the warnings of thinkers against the possible tyranny of opinion did not, and from the nature of things could not, shake the belief of democrats in the intimacy of the alliance between democracy and freedom.

The foundations of this faith are now threatened, not by the assaults of conservatism, but by a change which, during the last twenty or thirty years, has become very marked in the policy and in the sentiment of modern democracy. Freedom has brought many blessings to rich and poor alike; but it has not removed the difference between riches and poverty, between prosperity and misfortune. Though no reasonable man can doubt that the position of the body of the people is, certainly in England, and probably throughout the whole civilized world, far less painful, if we cannot exactly say far happier, than it was a century ago, yet the contrast between the classes and the masses, between millionaires and paupers, has become, if not greater, yet more observable than in the days of our fathers and grandfathers. Exaggerated hopes in the benefits to be derived from merely political innovations, such as the extension of the suffrage, directed men's attention almost exclusively towards the promotion of alterations of a constitutional character. Once let it be thought that liberty cannot of itself cure the diseases of society, and men who suffer, or think they suffer, from social maladies will naturally turn towards the panaceas offered by the believers in Socialism. When, as at the present day, the discontent of those who suffer is reinforced by the sympathy of classes so prosperous that they feel their own happiness impaired by the bare idea that their poorer neighbors should not enjoy all the pleasures of life, it is natural enough that democrats should become Socialists, and that the aim of democracy should tend to the promotion not of individual liberty, but of social, and in the main material, well-being.

Disguise the fact as men may, Socialism, in all its various forms, is and must be the opponent of individual liberty. Even if popular leaders tried to attain more or less Socialistic aims only through the agency of the State, this attempt would promote schemes, and even more surely would foster a condition of opinion, unfavorable to the right of every man to regulate all matters of conduct which primarily concern himself, in accordance with his own conception of right or of happiness. But it is not through the State alone that modern reformers or innovators attempt to carry out their ideas into action. Associations, leagues, unions, societies, in short, in which men with more or less respect for the law of the land band together for the support of the principles or course of action which commends itself to a particular class of persons, and for the suppression of opinions and hindrance of actions which the particular class condemn, are the most striking phenomena of the day. Such leagues or associations meet us at every turn. It is likely enough that the day is not far distant when capitalists on the one hand and workmen on the other will stand face to face, not man against man, but league against league. This state of things may, it is possible, have its advantages, but it will certainly produce, as the tendency towards it already produces, an indifference for the freedom of individuals. This is so for two reasons. A syndicate of merchants or a union of workmen must attempt to constrain the action of all rivals who do not belong to the syndicate or union. The coercion exercised may or may not be limited by respect for law, but in any case it militates against the unrestrained action of individuals.

Respect, again, for the law of the land is, at any rate in the modern world, the essential condition of private liberty. But the loyalty to a man's union or league tends to shake, if it does not actually shake, his loyalty to the law. Look at the matter from whichever side you will, and you are led to the same conclusion. The alliance between democracy and freedom is shaken; men are beginning to doubt whether the right of every man to regulate his own life (so long as he respects the rights of others) according to his own will, is compatible with the happiness of the majority of the people. The doubt may or may not be well founded—on this matter I say nothing. What I insist upon is, that the doubt exists. Its mere existence threatens to deprive the democratic movement of that element of enthusiasm for liberty which has been hitherto the source of what I may term its spiritual life.

AN OBSERVER.

Correspondence.

THE RECESSION OF NIAGARA.

TO THE EDITOR OF THE NATION:

SIR: The letter on "The Recession of the Niagara Gorge," in the *Nation* of March 19, has brought to my hands an interesting description of the Falls as seen in 1832 by an English gentleman still living, Mr. Henry Ransford of Brighton, Sussex. He writes:

"I believe I possess the oldest extant sketch of the Falls, which I took in 1832, with a camera lucida, from the top of Forsyth's Hotel, so that the distances and position of the various points are correct. The estimate of Sir Charles Lyell, that the Falls recede one foot in a year, is erroneous, from careful observation. When revisiting Canada thirty-eight years afterwards, I took the sketch and the camera with me, to see what changes had taken place during that period. The edge of the fall, where it joins Goat Island, had not perceptibly receded; on the Canadian side the ground above the side of Table Rock before it fell was much the same; but the curve of the horse-shoe part, so called, had receded superficially, thus widening the broken water of the rapids, from the surface only having worn away; a comparatively small part of the edge had been worn deep down the front. I have seen a statement that the distance between Table Rock and Goat Island was 1,650 yards. My sketch is only seven inches across (not being a front view), being therefore on a scale of 236 yards to the inch. Taking a position where Table Rock stood, in a line with the junction at Goat Island, I paced carefully up stream and found the horse-shoe as described extended back 236 yards. Not quite half way from Goat Island, the straight edge had worn away (*i. e.*, *cut back a section*) some 240 yards by 60 deep. Two hundred yards further on, another opening had worn back some distance at so sharp an angle that the water was pouring over *facing* where I stood, instead of being in a line with the rest of the fall.

"The American Fall in 1832 was a straight line like a tablecloth hanging over a rail; in 1870 it had receded in a perfect bow thirty yards deep, but the sides unaltered. I measured by pacing; being over six feet, I can step a yard very correctly. . . . On my last visit, in 1879, I observed the *opening* in the Horse-shoe Fall, where the falling water faced me, had widened and receded considerably, but not the whole of the horseshoe. Another twelve years have no doubt caused further recession."

Mr. Ransford adds: "My travelling days are over, although strong and healthy for my age. If I live to the end of August, I commence my eighty-eighth year."

Mr. Ransford is mistaken in thinking his sketch the oldest one of the Falls. The oldest is that given in Father Hennepin's description of the Falls, which he visited in 1678. A good cut of this view is given in Parkman's 'Historic Handbook of the Northern Tour,' p. 93. The second oldest that I know is in the *Gentleman's Magazine* for January, 1751.

EDWARD G. BOURNE.

ADELBERT COLLEGE, June 1, 1891.

AUTOMATIC DEMONSTRATION.

TO THE EDITOR OF THE NATION:

SIR: Important political changes are usually the result of some considerable disaster which makes the minds of men receptive, and it seems as if the finances of the United States might, sooner or later, administer a lesson sharp enough to overcome the reluctance of Congress to admit the Secretary of the Treasury to a share in its debates.

In the last two months we have exported an unusually large amount of gold, and though the "bulls" make light of it as an ordinary commercial transaction, there is a general and uneasy feeling that it may mean much more than that. The financial condition of Europe is far from reassuring. The complications in South America, including not merely the Argentine Republic, but Brazil and Chili also, have not yet worked out their full effect. There is talk of a further large demand for gold from Russia. The fearful militarism on the Continent engenders suspicion and unrest, and last, but not least, immense amounts of English capital are said in the last few years to have been embarked in joint-stock speculations in this country.

If the pull comes from the other side, there is also a push from this. Though we have not free coinage of silver, the Government purchases are enough sooner or later to land us on a silver basis, and the moment that comes in sight there may be a rush for and a demonetization of gold, which the existing silver coinage will be quite insufficient to replace.

To cap the climax comes the condition of the Treasury. For the last twenty years we have

pursued a course of steady inflation of banking credit, first through the national banks and then through State banks disguised under the name of "trust companies"; and it is a significant fact that, from the adoption of the Constitution down to the civil war, all serious trouble has come from State banks, a United States bank having twice been set up to drag them out of it, and overthrown as soon as they were relieved. From an historical point of view, the future relation of the national-bank system to the State trust companies will be very interesting. However that may be, several times during these twenty years, when this inflation has threatened its natural result of financial panic, the Treasury has stepped forward with its large reserve of gold, bought up bonds, and averted the danger, thus producing in the public mind the kind of reasoning which powerful medicine does in a man of dissipated habits, namely, that if the consequences of excessive indulgence are so easily relieved, it is not worth while to exercise self-denial. Now, however, it happens for the first time that the Treasury is not in a condition to play the part of *deus ex machinâ*. Whatever other incapacity Congress may have developed, it has shown itself able to get rid of any given amount of surplus. Not only is the Secretary drawing down the bank depositaries, but he has actually—*quantum mutatus ab illo*—come into the market with a bid for the renewal of the 4½ per cent. bonds due in September. The difference in his relation to the money market is a very serious factor.

In all this I am not attempting anything so rash as a prophecy of the money market, but only laying stress upon the fact that the greatest evil the public mind has to contend with is uncertainty. It has, and with reason, lost all confidence in Congress. It does not know whether that body will resort to free coinage of silver or pile up a new Pension or River and Harbor Bill, or whether it will repeal or double up the McKinley Bill. Could there be anything which would spread a greater feeling of relief through every honest financial interest in the country than the knowledge that, in the first days of next December, the man placed at the head of the national finances would stand up in Congress, make an oral exposition of the state of affairs and of his plans for meeting it, and would then hold himself in readiness to meet every comer in public debate? Compare this with the present method of casting materials, as heterogeneous as those of the witches in "Macbeth," into the caldron of the Committees of Ways and Means and Appropriations, and then waiting anxiously for six months to see what kind of conglomerate will result from it.

We have no man competent to do such work. No, and you never will have unless you try him. It is like refusing to go into the water till you know how to swim. Suppose it were a question of finding the best billiard-player in the United States. A candidate would not be selected because he was a sound Republican or Democrat, or as the largest contributor to the campaign fund, or as having most influence in the local caucuses. If he were, it would not be surprising that his supporters should be reluctant to have him play billiards. The obvious way would be to set up a table and invite competition among players of reputation. If the returns were published in the papers, there would be no difficulty in getting the best man, even if it depended upon the votes of all the population of the United States. Exactly the same process would produce a first-class financier, as it will be hardly denied that the material exists in the United States in plenty and of a quality unsurpassed in the world.

Supposing the worst should follow from the somewhat dismal indications which I began by pointing out, it would be more than compensated for if it opened men's eyes to the only way in which public finances can be successfully conducted. G. B.

Boston, June 13, 1891.

Notes.

D. Appleton & Co. announce a 'History of Modern Civilization,' adapted from the work of Gustave Ducoudray; a 'Canadian Guide-Book,' by Charles G. D. Roberts; and 'The Three Miss Kings,' a novel by an Australian writer, Ada Cambridge.

A cheaper edition (the fifth) of Mr. Henry T. Finck's 'Romantic Love and Personal Beauty' will be issued early in July by Macmillan & Co. They are also on the point of bringing out a third and revised edition, in one volume, at a moderate price, of Dr. Martineau's 'Types of Ethical Theory,' for the use of students.

John Wiley & Sons have in preparation 'Stones for Building and Decoration,' by George P. Merrill of the National Museum at Washington.

Ginn & Co. will shortly publish 'The Modalist, or the Laws of Rational Conviction,' a text-book of formal logic by Prof. E. J. Hamilton of Hamilton College.

Peter Paul & Bro., Buffalo, will issue 'The Life and Times of Kateri Tekakwitha, the Lily of the Mohawks, 1656–1680,' by Ellen H. Walworth.

'The Life Romance of an Algebraist,' by George Winslow Pierce, is in the press of J. G. Cupples, Boston.

Breitkopf & Härtel, Leipzig, will soon issue the third volume of Oesterlein's 'Katalog einer Richard Wagner Bibliothek.' These three volumes contain the titles and dates of about 30,000 articles, pamphlets, and books relating to Wagner. Oesterlein is the director of the Wagner Museum in Vienna.

Robert Bonner's Sons have got out an edition of Mary Howitt's translation of Hans Christian Andersen's 'Improvisatore.' The print is clear, but the illustrations are of a feeble sort.

It is only necessary to say of the new edition of Mr. W. C. Prime's 'I Go A-fishing,' just brought out by Harper & Bros., that the typography is handsome, and the deep green paper cover, with decorative stamp, well devised and decidedly tasteful.

Last month we made mention of a reprint of George Henry Lewes's 'Principles of Success in Literature,' emanating from the University of California. The utility of this work for the class-room has occurred also to Prof. Fred. N. Scott of the University of Michigan, whose publishers—and they have done well by him—are Allyn & Bacon, Boston. Prof. Scott furnishes an introduction and notes, and has corrected the typographical and other blemishes of the papers as originally printed in the *Fortnightly*.

Under the title 'Lamb's Essays: a Biographical Study' (Boston: D. Lothrop Co.), Elizabeth Deering Hanscom has collected some of the personal essays of Lamb, such as those on the Inner Temple, Christ's Hospital, the South Sea House, Mackery End, Dream Children, etc., making fifteen in all, and has annotated the personal and local allusions. The volume thus makes a kind of fragmentary autobiography, and has the charm of Lamb's most confidential and affectionate writing. A Life, prefixed, gives the necessary outlines of fact, which the selections fill up and vivify.

An *édition de luxe* of "Antony and Cleopatra" (New York: Duprat), printed at Paris by D. Jouaust, is well calculated to tempt the collector by the faultless taste of its typography, fine paper and margins, and indeed all the perfections that belong to the printer's art. It is a beautiful volume in the most elegant French style. Mr. W. J. Rolfe furnishes an Introduction, in which he quotes largely from Shakspere critics, and pushes to what we think an absurd extreme the suggestion that Shakspere drew *Cleopatra* after the "dark lady" of the Sonnets. The quotation of the 129th Sonnet, with the application made of it, is nothing less than offensive. Seventeen illustrations by Paul Avril give a more pronounced Parisian stamp to the volume. The edition is limited to 150 copies, distributed into three classes, differing in paper and expense.

The Rev. W. H. Lyon has written, and the Unitarian Sunday-School Society, Boston, has published, 'A Study of the Sects,' which is unique in its character, so very sympathetic are the accounts of the different sects of Christendom, among which the Jews are properly included. A chapter on the Jews is introductory, and then follows a chapter on "Doctrines Held by Christians," in which a little more on the great confessions would not have come amiss, especially at the present time. Next we have a series of chapters on the different sects, each in two parts: first an historical account and then a critical estimate, which is in every case a serious attempt on the writer's part to put himself in the place of those of whom he writes. In almost every case the chapters have been submitted to some competent member of the sect discussed; the corrections made have been accepted, and so the greatest fairness has been assured. There is no good reason why this manual should not be used in the Sunday-schools of all the sects which it describes.

From Mr. G. H. Wilson (152 Tremont St., Boston) we have received the seventh issue of his 'Musical Year-Book of the United States (1890-1891),' a very useful little volume of 140 pages, convenient for reference, and containing in its lists of performances, as well as in a retrospective chapter, many suggestive facts regarding the present state of musical affairs in this country. Mr. Wilson, although a Bostonian, and justly proud of the orchestral concerts, the chamber music and vocal performances in his city, admits that as long as Boston is bereft of opera, all arguments claiming general musical precedence for that city are futile. It is the German opera that has made New York the musical centre of America; but with the reappearance of flimsy Italian opera at our Metropolitan house, Boston may again become—what it used to be—the musical metropolis of the country. One of the most interesting parts of Mr. Wilson's 'Year Book' is the excellent index, because it shows at a glance the comparative popularity in America of various composers. Some of the Americans, like Paine, Foote, Buck, MacDowell, and Chadwick, have a good showing. It is encouraging to see Bach with eighteen entries, but the fact that Franz has only five indicates the weakest point of our musical culture—the shameful neglect of German *Lieder* in our concert halls. The most striking lesson given by this index, however, is the almost utter disappearance of Italian music. Bellini, Donizetti, Rossini, and Verdi together have only twenty-nine entries, while Wagner alone has 183.

Mitchell's, 830 Broadway, has reprinted an edition of 100 copies of Mr. Henry B. Dawson's 'Records of the City of New Amsterdam in New Netherland,' vol. i., which originally appeared in 1867, in an edition equally restricted. These curious economic and police decrees of Peter Stuyvesant, Director-General, ranging from 1647 to 1655, are the earliest records of our corporation. They are given in an English version. The pages have broad margins and the volume is very prettily bound.

The bound volume of the *Century Magazine* completed in April, and variously numbered 41 and 19 in the old and new series, is most distinguished by the first of the extracts from the Talleyrand Memoirs. The California papers have been continued; the whole of Mr. F. Hopkinson Smith's veracious story, "Col. Carter of Cartersville," has been given; the beginnings of a future book—a series of characteristic American pictures, with biographical sketches—have been made; the luxurious change of home of the New York club of which the magazine is a namesake, is celebrated with illustrations, and the rest of the contents presents the well-known miscellany on which we have commented from month to month.

A certain number of colleges now offer science courses for students intending to study medicine, or otherwise engage in biological work, and the Illinois State Board of Health, which has the power to grant licenses to local practitioners, desires to make up a science course fit to be recommended for the above purpose to all colleges disposed to adopt it. A circular asking for practical suggestions has been sent out by the Secretary, Dr. John H. Rauch, whose address is Springfield, Ill.

The Deerfield, Mass., Summer School of History and Romance will begin its sixth season on July 2, and be in session throughout the month. The list of lecturers embraces many well-known names of literary men and women. The President is Mr. L. J. B. Lincoln.

—In the Papers of the American Historical Association, Prof. Kuno Francke of Harvard treats of "Karl Follen and the German Liberal Movement, 1815–1819," with a special view to the paradox involved in the transatlantic revolutionary aims and methods of Follen, and his cisatlantic mildness, gentleness, and even saintliness. He takes for his point of departure Whittier's beautiful portrait of the victim of the fiery *Lexington*, and then briefly describes the Burschenschaft patriotic organization of Young Germany after the country had been freed from Napoleon only to fall under the reactionary control of the Congress of Vienna. He then avails himself of the more recent literature illustrating this movement to set forth Follen's doctrine of resistance to tyrants, which was not essentially different from the Nihilist doctrine of the modern Russian, and in the light of which the fate of "Polonius" Kotzebue and Von Ibell could neither be deplored nor condemned. The lesson taught by these assassinations, which had no director or accomplice in Follen, though Prof. Francke says it is impossible not to trace them both back to his teaching, was that which the Nihilists are learning: the millennium was not hastened but retarded by violence. Follen became an exile, to the profit of this country, where he passed, and truly, for one of the mildest-mannered of men. He was the first professor of German literature at Harvard, introduced there the gymnastics of the Turners, and had every prospect of ending his days in the service of the University. His very temperate support of the abolition movement, however, cost him his position at the expiration of his engagement, and he died a minister of the gospel of the Prince of Peace. Prof. Francke gives numerous examples of the stirring revolutionary lyrics of Follen and his associates in the Fatherland, and they make us realize how far the cooling of the crust of the political world has gone on in seventy years. Revolutions are doubtless still impending in western Europe, but that they will be ushered in with song seems daily less probable.

—The article of most general interest in the ninth annual report of the United States Geological Survey, lately issued, is the history of the Charleston earthquake of August 31, 1886, by Capt. C. E. Dutton, with some assistance from Ensign Everett Hayden. About four thousand reports of the effects of this occurrence in different States were received, and, owing to the general use of standard time, it was found possible to make good use of many of these in determining the velocity of the transmission of the earth-wave from the chief centre of disturbance, about twenty miles northwest of Charleston, to various parts of the country. The velocity attained was somewhat over three miles a second, about equal to the theoretical velocity of a wave in a uniform homogeneous elastic medium, like the average of the rocks of the earth's crust. This velocity is much greater than has been found in other earthquakes, but Capt. Dutton believes that it is of sufficient accuracy to outweigh all previous results. Twenty-seven persons were killed and many more died from exposure. More than five thousand buildings were more or less injured and nearly fourteen thousand chimneys were overthrown in Charleston alone; the money loss in that city was estimated at between five and six million dollars. The report is finely illustrated from photographs, mostly taken under the direction of Mr. W. J. McGee of the Survey, who visited the district immediately after the chief disturbance. The craterlets, formed by water gushing up from sandy layers at a little depth, are fully portrayed. There was nothing whatever of volcanic quality in Carolina. In attempting to explain the process and propagation of the earthquake, Capt. Dutton is forced to abandon the geometrical views of Mallet, which came into fashion with his famous report on the Neapolitan earthquake of 1857. The waves at Charleston were too unsymmetrical and complicated to be determined by their effects in cracking walls and overturning chimneys; and as a similar scepticism has come over the students of the numerous earthquakes in Japan, we fear it is necessary to take leave of Mallet's methods, though with regret, for his was too pretty a theory to give up willingly. As the angle of emergence of the waves could not be defined, the depth of the earthquake focus was determined by means of a novel method of discussing the rate of decrease of destructiveness on the surface—chiefly from observations by Mr. Earle Sloan of Charleston, whose contributions in this direction are pronounced of the highest value. The seat of the disturbance was thus estimated to lie at a depth of twelve miles. The rate of progress of the wave already referred to is regarded as the chief scientific result of the monograph.

—Kettler's *Zeitschrift für wissenschaftliche Geographie* (1890, Ergänzungsheft No. 2) contains an interesting paper of fifty-three pages entitled 'Die Orientfahrt des Ritter A. von Harff; Beiträge zu einer Kritik seiner Reisebeschreibung,' by R. Frhr. von Seydlitz. Recent criticism has played havoc with the reputations of many mediæval travellers for veracity, showing that they often relied upon their imagination for facts, recorded vague rumors or the statements of other writers as the results of their own observation, and did not hesitate to continue their journeys on paper wherever they found it inconvenient to go in person. The Oriental journey of the Ritter Arnold von Harff took place during the last three years of the fifteenth century, and although his account of it was written soon after his return in the autumn of 1499 and dedicated to his sovereign, the Duke of Jülich and Bergon-the-Rhine, it was first printed at Cologne in 1860 by Dr. E. von Groote, who based his text on a collation of three manu cripts. It may be added that the so-called Düsseldorf manuscript, supposed by the editor to be lost, is at Treves. There are also several other manuscripts in existence: one at Neuhaus, a castle on the Danube, another in the University Library at Bonn, a third in the Court Library at Darmstadt, and a fourth in the University Library at Giessen. These eight manuscripts, and there were doubtless many more, suffice to prove that the work excited no inconsiderable degree of contemporary interest. Its publication under the title 'Die Pilgerfahrt des Ritter A. von Harff' called forth much adverse criticism; the author was accused of copying his descriptions from Marco Polo and other travellers, and, in general, of drawing a bow of such prodigious length as to send his arrows into lands which his eyes had never beheld. One critic asserted that of all the places mentioned by Harff in his explorations of the Nile not one can be shown to exist—a reckless statement which Baron von Seydlitz successfully refutes. It is also a striking coincidence that, at the time when this criticism was made, Speke discovered the source of the Nile near the spot where Harff claims to have found it. Von Seydlitz follows Harff in his itinerary step by step, points out his errors and exaggerations, his love of marvels, and his easy credulity in accepting them, but completely vindicates his character as an honest and would-be truthful man, who, however, was utterly incompetent to discriminate between fact and fiction. He set out as a pilgrim to visit sacred shrines for the saving of his soul, and, with his confirmed mental habit of everywhere looking for wonders, it is the greatest wonder of all that he did not discover more. These rather uninviting investigations, which are pursued with commendable patience, conscientious thoroughness, and remarkable critical acumen, serve at least to relieve Harff from the imputation of being a wilful deceiver, and, by deciphering and identifying several names of places—such, for example, as Edessa for Orissa (p. 38), and Phasagar for Usagara (p. 41)—make a positive and valuable contribution to geographical science. A map, giving the direction and extent of Harff's travels, accompanies the text and is a welcome aid to the reader.

BROWNING'S LIFE AND LETTERS.—I.

Life and Letters of Robert Browning. By Mrs. Sutherland Orr. 2 vols. Boston: Houghton, Mifflin & Co. 1891.

THE Life of Robert Browning begins, naturally, in the hands of a writer of so scientific a cast of mind as Mrs. Sutherland Orr shows herself, with the subject of heredity both in temperament and physique. The first point brought out is that the poet was neither Jewish nor Creole by blood, as has been thought in some quarters. There is no trace of either the Hebraic or the negro strain. The family

is not traced by the biographer, except in a very general way, beyond the grandfather, a clerk in the Bank of England, a handsome, vigorous man of the provincial type, whose literary tastes were divided between the Bible and 'Tom Jones,' both of which he is said to have read annually. He was not a fond parent, and his son, the father of Robert, seems to have owed little gratitude to one who denied him unnecessarily a university career and broke with him in other matters. The latter obtained a good education, especially in the classics, and, on getting on in life, after giving up a lucrative employment on his mother's West Indian estates in disgust at negro slavery, he developed a character of much individuality. He, too, was a bank clerk, but, as Mrs. Orr aptly says, he exhibited as talent what in the poet was genius. He had the habit of sketching and also of grotesque rhyming, and impressed both on his son in childhood; he was a lover of rare books, a wide reader, of the laborious class that makes notes in all volumes read, and he came to have a special knowledge of early Italian, French, and Spanish literature. His son was indebted to him for information and research on the more recondite subjects of his verse. Latterly he lived at Paris, and was remembered by those who met him as a striking old man.

Few anecdotes are told of him, but they are illustrative of character. He is said to have changed his restaurant in London because the waiter insisted on giving him the trouble of saying what he would have to eat. In his last hours he displayed such unusual firmness and cheerfulness that the physician inquired of his daughter if he knew he was dying; and the old man replied: "Death is no enemy in my eyes." "What do you think death is, Robert," he said; "is it a fainting or is it a pang?" His last words were to his son, who was fanning him —"I am so afraid that I fatigue you, dear." Altogether a fine character as we see him here, a lifelong scholar, and otherwise of cultivated tastes, without any touch of sordidness or the narrow spirit which might have been expected from his circumstances, and able and willing to direct his son at the beginning of his intellectual life, to sympathize with him, and to support him afterwards in the face of the pecuniary failure of his works. For this alone, Browning declared to a friend, he "owed more to his father than to any one else in the world."

In his childhood, Browning appears to have been the traditional prodigy of a small circle. When he first went to school, he was so much quicker than his companions that he had to be removed because the other patrons of the school were jealous of the attention given to him. The teacher is reported to have "retorted on the discontented parents that if she could give their children 'Master Browning's intellect,' she would have no difficulty in satisfying them." He was a child of much sensibility, and, owing to his mother's influence, it showed itself in religious feeling. He described himself as "passionately religious" at this early period. A characteristic anecdote to illustrate his sensitiveness relates that on hearing the tale of the lion who was kicked to death by an ass, he took such a hatred of the book that he hid it away in the seat of an old chair so as never to see it again. He was a lover of animals, and kept "owls and monkeys, magpies and hedgehogs, an eagle and even a couple of large snakes, constantly bringing home the more portable creatures in his pockets, and transferring them to his mother for immediate care." This taste he maintained through life, and we read of his bringing snakes to his boy "Pen" at the Baths of Lucca. When he first experienced homesickness, he chose a cistern near the school for his place of burial, and used to pass his hand over a raised face on it, chanting "In memory of unhappy Browning," till the "acute stage of the feeling had passed away." Such incidents serve to show his emotional temperament and his interests. From the first, however, books made a large element in his idea of the world. His father's house was packed with them, and among the thousands of volumes were those on which youthful genius has often been nourished—'Robinson Crusoe,' 'Milton,' and the rest. He made Quarles's 'Emblems' an early favorite. At the age of twelve he had written his first manuscript volume of poems, called 'Incondita,' strongly Byronic. He wished to publish, and his father and mother encouraged the project; but no publisher was found. It served only by an accident to introduce the boy to the Unitarian minister, W. J. Fox, from whose heirs the poet long afterwards received a copy, and then destroyed it. Mr. Fox and the Misses Flower, one of whom wrote 'Nearer, my God, to Thee,' were his first literary acquaintances, and the connection was long maintained. He showed also in boyhood a taste for acting, and joined in juvenile theatricals.

Browning's individual life, however, really began with his acquaintance with Shelley's poems, and the story has often been told how he got at Ollier's the invaluable first editions, with Keats's works thrown in at the bookseller's suggestion, as being likely to please one who enjoyed Shelley. The fervor of Shelley would naturally stir a youthful poet, and Browning seems always to have valued Shelley rather for his spirit and the inspiration the verse breathes out than for the works alone. There was also at first, we think, a direct intellectual and moral appeal. It is said that the poems which attracted Browning were "Queen Mab" and the others of that strain. He became under this influence a professed atheist and a vegetarian, and for two years he confined himself to a vegetable diet. The real truth of the matter was that Browning was bred somewhat narrowly in the orthodox faith; and Mrs. Orr describes this youthful scepticism rightly as "a passing state of moral or imaginative rebellion," not of rational doubt. In connection with this we find the youthful qualities naturally to be expected. Browning was a man of impatient temper, self-asserting, and not without a good conceit of himself; as a boy, he showed these traits in a crude and apparently a disagreeable form. Mrs. Orr's account of it is as follows:

"It was natural that during this time of growth he should have been not only more restless, but less amiable than at any other. The always impatient temper assumed a quality of aggressiveness. He behaved as a youth will who knows himself to be clever and believes that he is not appreciated, because the crude or paradoxical forms which his cleverness assumes do not recommend it to his elders' minds. He set the judgment of those about him at defiance, and gratuitously proclaimed himself everything that he was and some things that he was not. All this subdued itself as time advanced and the coming man in him threw off the wayward child. It was all so natural that it might well be forgotten. But it distressed his mother, the one being in the world whom he entirely loved; and deserves remembering in the tender sorrow with which he himself remembered it. He was always ready to say that he had been worth little in his young days."

This is a sufficient characterization of his youth. He was affectionate towards his mother, but otherwise his emotions were torpid, and long remained so. He had been through the usual studies, including all physical exercises usual to a gentleman's education, but apparently with an entire neglect of mathematics and logic. In this omission Mrs. Orr finds, perhaps justly, the secret of his confused style and imperfect expression. He also developed the taste for music and wrote it for songs.

In the early, though anonymous, publication of 'Pauline' there is another sign of the forward and self-confident nature of the young man. By it he renewed his acquaintance with Mr. W. J. Fox, whose praise it won in a review, but it made no impression upon the public, though we know now that it attracted Mill's attention, and twenty years after so pleased Rossetti that, only suspecting its authorship, he copied it out so as to possess it. A journey to Russia as secretary to the Russian Consul-General in 1833–34 followed, and suggested diplomacy as a career, but application for employment in it failed. 'Paracelsus' was then published, and the author began to move in literary circles, meeting Serjeant Talfourd, Horne, Leigh Hunt, Barry Cornwall, Milnes, and among the rest of greater note Wordsworth, Dickens, and Landor. The only productive friendship was that with Macready, which resulted in the composition of the dramas. The account of the unfortunate break in the cordial relations of the poet and the actor is given by Browning himself. The incident need not be dwelt upon. A not unpardonable lack of frankness on Macready's part, and an aggressive and irritating demeanor on Browning's side, brought about one of those mutual misunderstandings which are the source of many such separations.

Together with the plays, the production of 'Sordello' and 'Bells and Pomegranates' contributed to the reputation of Browning within a certain circle, and in his personal life two journeys to Italy helped to fertilize and develop his poetical faculty. During his first London period he mingled much with the literary set, and was praised by his private friends, but his fame did not show signs of growing, and he afterwards based on this fact an opinion that literary acquaintance was not of so much value in securing recognition as it is thought to be. In person at this time he is described as "slim, dark, and handsome," and, says the same authority, the daughter of Mr. Fox, "just a trifle of a dandy, addicted to lemon-colored kid gloves and such things, . . . full of ambition, eager for success, eager for fame." Mrs. Orr does not think he was ever "foppish," but sustains the view that he was full of confidence, excitable in his moods, with a touch of flippancy and conceit, and also of warm gratitude for kindness and of enthusiastic admiration of others' talents. She remarks upon the lack of emotional life in this period of his career, that is, the life of the affections. The immaturity of his mind and the tentative nature of his art are well shown by an extract from the correspondence of 1838 or 1839: "I am going to begin the finishing 'Sordello,' and to begin thinking a Tragedy (an Historical one, so I shall want heaps of criticisms on 'Strafford'), and I want to have another tragedy in prospect; I write best so provided. . . . I want a subject of the most wild and passionate love to contrast with the one I mean to have ready in a short time. I have many half-conceptions, floating fancies: give me your notion of a thorough self-devotement, self-forgetting: should it be a woman who loves thus or a man?" His experience of love came five years after this was written.

The narrative of the engagement and marriage of the poet to Miss Barrett, and of their

life together, is given with much fulness, and is, we think, the most interesting portion of these volumes. He was introduced to her by her cousin, Mr. Kenyon. They became at once mutually attached, and he proposed marriage "under a sudden and overmastering impulse." Miss Barrett had long been an invalid, and was supposed to be incurable. The doctor advised that she be sent south for the winter, but her father did not assent to the plan, evidently thinking it would prove useless. Miss Barrett then determined to accept Mr. Browning's offer and elope. She first drove to Regent's Park, and tried to step on the ground, and did so probably only for a moment. When she "felt earth under her feet and air about her," she said, "the sensation was almost bewilderingly strange." They were married September 12, 1846, at St. Pancras Church, and Mr. Browning, whenever he came back to London afterwards, used to go and kiss the paving-stones before the church in memory of the event. A week later Mrs. Browning left her father's house secretly, by the connivance of her sisters and maid, and took Flush, her dog. "O Flush," she said, "if you make a sound, I am lost." Mr. Browning was in waiting, and they departed for the Continent. The marriage had been entirely secret, and Mr. Barrett and his sons were much enraged. He never forgave his daughter, never saw her, and would not see her child when she offered to send him. He said afterwards to Mr. Kenyon: "I have no objection to the young man, but my daughter should have been thinking of another world."

Mrs. Orr does not underestimate the grave risks that were taken by the Brownings. His own family were naturally most concerned lest the experiment should prove fatal to Mrs. Browning and he should be blamed. She was, though he did not know it until later in life, six years his senior, and the prospect was at best that of the union of a hopeless invalid with a husband of no experience or understanding of illness. All turned out fortunately; she gained in health, and they were happy together. Mrs. Orr says, however, that to suppose that this union "maintained itself as if by magic, without effort of self-sacrifice on his part and of resignation on hers, would be as unjust to the noble qualities of both as it would be false to assert that its compensating happiness had ever failed them." He was wholly devoted to her welfare, and she was proud of him and very happy. Her letters abound with expressions of her belief in his perfections: "Temper, spirits, manners—there is not a flaw anywhere"; and again, in connection with an error of judgment, which resulted in their having to hire two houses, she writes: "Any other man, a little lower than the angels, would have stamped and sworn a little for the mere relief of the thing—but as to *his* being angry with *me* for any cause except not eating enough dinner, the said sun would turn the wrong way first." The household picture that follows this passage is fairly illustrative. Mrs. Browning was able then to take only a twenty minutes' walk up and down in the piazza. "Miss Boyle," she says, "ever and anon comes at night, at nine o'clock, to catch us at hot chestnuts and mulled wine, and warm her feet at our fire—and a kinder, more cordial little creature, full of talent and accomplishment, never had the world's polish on it. Very amusing she is, too, and original; and a good deal of laughing she and Robert make between them, and this is nearly all we see of the Face Divine—I can't make Robert go out a single evening." The only difference that ever rose between them was about spiritualism, in which Mrs. Browning believed; and she annoyed her husband by refusing to credit his own expressed disbelief, and insisting that they could not disagree. The circumstances connected with spiritualistic manifestations were more distasteful to him, probably, and there must have been something disquieting in the notion of his wife's entertaining impostures which cannot safely be thought harmless.

THREE TEXT-BOOKS OF PHYSIOLOGY.

A Text-Book of Physiology. By Michael Foster, Professor of Physiology in the University of Cambridge. 5th ed. Parts I., II., and III. Macmillan & Co. 1888–1890.

A Text-Book of Physiology. By John Gray M'Kendrick, Professor of the Institutes of Medicine in the University of Glasgow. Including Histology, by Philipp Stöhr, Professor of Anatomy in the University of Zürich. Vol. II. Special Physiology. Macmillan.

A Text-Book of Animal Physiology. By Wesley Mills, Professor of Physiology in McGill University and the Veterinary College, Montreal. D. Appleton & Co. 1889.

THE fifth edition of Foster's 'Physiology,' as stated in the preface, is of the same general character and arrangement as that of previous editions. That is, the general and special problems of physiology are brought forward and briefly discussed in an introduction, and then taken up in detail, with frequent summaries which bring each subject to a focus so that its main facts, conclusions, and hypotheses may all be seen at a glance and in their true relation. While it is true that this edition is in general similar to the older ones, it seems like a new book as compared with the first, second, or third. In them but few figures were given, and these were mostly of physiological apparatus and tracings or curves; in the present edition, while these are retained, and many more of the same kind added, there are many anatomical and histological figures, making 133 in the three parts already published, against 72 in the entire work as published in the third edition. The anatomical figures are very welcome, as it is doubtless easier for any one to gain some concrete notion of a function if the functioning organ and its structural details are exhibited.

The author is especially gifted in bringing out with great force and clearness just the problems to be solved and the result of the efforts already made to solve them. For example:

"In the first place, there are what may be called general problems, such as, How the food after its preparation and elaboration into blood is built up into the living substance of the several tissues? How the living substance breaks down into the dead waste? How the building up and breaking down differ in the different tissues in such a way that energy is set free in different modes, the muscular tissue contracting, the nervous tissue thrilling with a nervous impulse, the secreting tissue doing chemical work, and the like? To these general questions the answers which we can at present give can hardly be called answers at all."

On almost every page of the book are changes from the earlier issues. Indeed, the various editions of this work form a very complete and safe guide to the progress in physiology, and indicate the great fitness of the author for the task of presenting to students a kind of summary of the state and progress of knowledge in this department. He seems to have no pet theories to carry through in spite of changing views and increased knowledge. In no department of anatomy and physiology has the activity of original investigators and real progress been greater than in that of the central nervous system, the subject of the third part of this treatise; certainly no part shows such marked changes in the different editions, especially in this last one. Here, too, have been felt more keenly than in other parts the fetters of the old, stilted and ambiguous anthropomorphic anatomical terminology. So largely must the anatomy, embryology, and physiology of the lower animals be drawn on in explanation and illustration of the fundamental facts and principles of structure and function, that even the author, who in a previous publication ('Practical Physiology') described the lower animals as if in the erect attitude of man, has felt constrained to adopt what has been so earnestly advocated on this side of the Atlantic, viz., a terminology determined by inherent structural relations at all periods and without regard to the various attitudes with respect to the earth assumed by the different animals in adult life. It must be said, moreover, that this terminological change has had no inconsiderable share in making the morphological account of the central nervous system one of the very best and most intelligible in any language. As the changes are greatest in this part, the lack of the footnote references of the earlier editions is more keenly felt than in the other parts of the work.

The discussion of the physiology of the central nervous system occupies considerably less than half of the 288 pages of the third part. As it is without doubt the highest stage of physiology, so is the interest attaching to it the most absorbing. It is here that the fitness of the author is especially apparent. Nothing could be more lucid than his accounts of the experiments and the conclusions to be drawn from them, and, further, nothing could be of more real assistance to the student or reader than the repeated cautions against ascribing too much significance to isolated phenomena. Yet so constant and clear are the results of experiment that the author feels justified in saying:

"In short, the more we study the phenomena exhibited by animals possessing a part only of their brain, the closer we are pushed to the conclusion that no sharp line can be drawn between volition and the lack of volition, or between the possession and absence of intelligence. Between the muscle-nerve preparation at the one limit, and our conscious willing selves at the other, there is a continuous gradation without a break; we cannot fix on any linear barrier in the brain or in the general nervous system, and say, 'Beyond this there is volition and intelligence, but up to this there is none.'"

Prof. Foster is especially careful throughout not to assume too readily that the results of experiments on the frog, bird, or one of the lower mammals can be applied directly to a man or a monkey; and repeatedly insists that great caution must be exercised in interpreting the results of experiments. The phenomena immediately following an operation may wholly disappear as the animal recovers from the shock; and, when recovery is complete, although there is no regeneration of the part removed, the animal may so far recover its normal mode of action that it would be difficult or impossible in many cases to determine exactly or even approximately what part had been removed. This holds with even so highly organized a creature as the dog.

In the second volume of Dr. M'Kendrick's work is given the special physiology or physiology proper, except that of muscular tissue, which is discussed in the first volume. In ge-

neral character and style it is a distinct improvement on the earlier volume, already noticed by us. It has far less matter that seems subsidiary, and goes directly to the point in most subjects. The faults of the general plan are brought out very clearly, inasmuch as structural details concerning the blood, the nervous system, etc., given in the first volume, are repeated in this in connection with the various organs and systems. But as a rule the discussion of structure is more satisfactory in the present volume, and perhaps, on the theory of "line upon line," it is an advantage frequently to review. The author's treatment is direct and forcible, proceeding from strong convictions, and in most cases the conclusions arrived at show a familiarity with the best as well as the latest work. It is gratifying to see that the work of American physiologists is recognized, and, in general, that opposing views are fairly presented. In matters of detail there is evidence of too great haste or a trusting to the statements of older authorities. For example, the statement is repeated from the first volume concerning the elliptical form of the red-blood corpuscles in birds, reptiles, and fishes, no exception being made for the circular, bi-concave red corpuscles of the lamprey. It is also stated that "no corpuscle similar to the colored corpuscle is found in the blood of invertebrates," while a work frequently cited by the author gives examples of several invertebrates in which there are special blood corpuscles containing hæmoglobin, the red coloring matter of the corpuscles of vertebrates. General statements are sometimes made where particular ones would be preferable, as, in discussing lymph hearts, it is stated that the "amphibians possess four." This is true of the frog, but in some members of the group as many as twelve are present. And on p. 248 it is said that in passing from large arteries to their branches the combined area of the branches always exceeds the trunk vessel, except with the abdominal aorta, whose area is greater than that of the two iliacs into which it divides, while on p. 257 it is stated without exception that "the sum of the diameters of the branches of an artery are always greater than the diameter of the artery from which they sprung."

The third treatise under consideration is smaller than either of the others, but covers a much wider field. As a rule the presentation is clear, accurate, and emphatic; and in common with the first, and a great many other books, the excellent plan is followed of bringing the salient points of a chapter together in a comprehensive summary at the end. The general tone and spirit, and the reason for the title 'Animal Physiology,' may be understood from the preface:

"I think any one who will examine the methods and reasoning of the physiology of the day will not fail, on close scrutiny, to recognize a tendency to speak of certain conclusions, for various organs [and functions] as though they applied to these organs in whatever group of animals found, or, at all events, for man, no matter what the species of the animal that had been experimented upon. For some years I have, in publications of my own original researches, strongly protested against such methods as illogical. I am wholly at a loss to understand how a work, built upon the most fragmentary and heterogeneous evidence, derived from experiments on a few groups of animals, or a certain amount of human clinical or pathological evidence, can be fittingly termed a treatise on 'human physiology.'"

It is clearly out of the question at the present day for an author to give in a book of 700 octavo pages anything like an adequate account of general biology, comparative embryology, animal physiology, and the application of evolution to them, which Prof. Mills claims to be original with himself. There inevitably results a greater or less amount of superficiality and broader generalizing than the actual state of knowledge warrants. Although this book is in many respects excellent, and the majority of its statements accurate, contradictions, bad generalization, and half truths are too numerous. Indeed, all the sins inveighed against in the preface and in other parts of the book are found too frequently in its own pages.

THE SOURCES OF AMERICAN LIBERTY.

Droits et Libertés aux État-Unis. Leurs Origines et leurs Progrès. Par Adolphe de Chambrun. Paris. 1891.

THIS book is the first attempt, we believe, to explain to Frenchmen the origin of the rights enjoyed by American citizens. The British Constitution has been more than once expounded to the French public by French observers, but, so far as we know, there is no other book which explains to Frenchmen not only what American legal institutions are, but how Americans came by them. Tocqueville's work is rather an explanation of the effect of democracy on the manners and on the working of the Governmental machinery than a history of legal ideas. He was profoundly impressed by the strides democracy was making in his own day in all the countries of the Western world, and greatly interested in the probable effect on society and politics of the principle of equality which, after all, supplies democracy with its motive force, and to a considerable extent with its morality. He came to America to study it in the belief that it was here that he could see its working with least disturbance from tradition or inheritance. The consequence is that 'Democracy in America,' great as are its merits, and wide as its fame has been, has always been considered defective on the historical side, and has done but little to make clear to Frenchmen the exact nature and value of the indebtedness of the people of the United States to the great foundations of English jurisprudence. That Americans enjoy English freedom in the English sense, everybody knows, but we imagine very few Frenchmen, very few even of the readers of Tocqueville, are familiar with the exact means and appliances by which this freedom is preserved from generation to generation, both against the encroachments of political power and the storms of popular passion. It is these means and appliances of which M. de Chambrun has undertaken to give the history and describe the working.

The task is one for which hardly any Frenchman can qualify himself, even by long residence in either England or the United States. There is nothing in Anglo-Saxon manners and customs which the Frenchman of to-day finds harder to understand than our legal procedure, with its oddities of terminology and its external absurdity, its steady presumptions against the Government, and its extremely circuitous methods of attaining politico-legal ends. Frenchmen and other Continental Europeans, therefore, often live half their lives in the countries under the common law with nothing but the vaguest notion of its working or of the origin of its fundamental assumptions; and nothing is more common than to find them ascribing whatever in it is hard to comprehend to the eccentricity of the Anglo-Saxon character.

M. de Chambrun enters on his task with the very rare combination of qualifications—long residence in the country and long practice of American law for French clients. After his minute study of Anglo-Saxon institutions, here is what he says as to the resemblance between American and English politico-legal institutions (p. 349):

"Aside from the question of religious liberty, which, as we shall see presently, cannot be understood in the same sense in the two countries, I believe the English and Americans have maintained almost the same principles, and that after one hundred years of separation the individual rights are in the case of each about equal. I think, too, that, except in the matter of applying the Constitution to the law, the English judge exercises power as effective for the protection of the liberty of the English subject as the American judge for the protection of the American citizen. On these capital points the two peoples are in perfect accord. They walk by the same light and are guided by the same principles."

When M. de Chambrun comes to compare the United States and France from the same point of view he has a very different story to tell (p. 357):

"On many occasions," he says, "it has fallen to my lot to respond to the toast, 'France: The Ancient Ally of the United States.' As I did not wish to repeat the old phrases about General Lafayette, I looked about carefully, but vainly, I confess, for a point of *rapprochement*, or at least a point of contact, between the social and political institutions of the two countries. I was not able to discover anything of the kind. Our Civil Code . . . is just the opposite of the Common Law. At the same time, our civil institutions everywhere strike down free association. In France it seems as if this were the enemy that must be strangled. In the United States, on the other hand, it is the protégé of the law. Higher still in the order of institutions appear the rights of man. In France one can hardly find traces of these rights, so completely are they crushed out between the articles of the Code of Criminal Procedure and the Penal Code. In the United States they constitute sacred rights reserved to the citizens."

The chapters on criminal procedure, in which the precautions taken in England and America for the protection of the accused against oppression in any form are fully expounded and illustrated for the benefit of Frenchmen, are perhaps the most interesting and instructive in the book. The various differences between the position of the prisoner at the bar in France and in England or America are described by M. de Chambrun with much clearness, and he makes no concealment of his preference for the English mode of trial. The teasing interrogation of the French prisoner by the judge by which all French trials are opened, and which is often cruel enough to be put in the same category with the "question préalable" of the old régime, he condemns emphatically. The judge in America, he points out, takes no part in the prosecution. He simply sits as arbitrator between the State and the defence, who fight out their quarrel before him on a perfectly equal footing. The counsel for the Government, too, instead of sitting up on a raised dais, as a superior personage, has to contend on the floor with the counsel for the defence, exactly as in a civil suit. All this would seem shocking in French eyes, as would also the impregnable silence in which the prisoner is allowed to take refuge until the State has produced its proofs.

M. de Chambrun has, we think, hardly made as clear as he might have done the close connection which this position of the State in criminal prosecutions in America has not only with the legal traditions touching individual liberty, but with the whole attitude of the American and English community towards the Government. The habit of electing executive and legislative officers, which has always existed in some degree in Anglo-Saxon countries, has kept the people constantly in mind

of the strictly fiduciary character of the administration, and prevented its ever taking on the air of a final source of authority. The same causes which in France release a Government agent from responsibility to individuals for wrongful acts before ordinary tribunals, give the French prosecuting officer a semi-judicial character, and put the prisoner into the hands of the judge for preliminary mental torture. The dignity of the State has to be maintained at any cost in every department of administration. None of its representatives must ever be allowed to place himself on an equality before the law with any individual. In all countries which have emerged from despotism the prestige of the Government seems of enormous importance, as compared to individual rights and liberties, and this tradition shows itself nowhere so strongly as in courts of justice. To the sanctity of this tradition the individual finds himself sacrificed at every turn. The infallibility of the State has to be cared for as tenderly as discipline in the army, as part of the framework of society.

But we do not mention this as an impeachment of M. de Chambrun's accuracy. The precision and judgment with which he steers his way through the maze of English and American legal authorities are very remarkable, and, as we have said, would hardly have been possible for a Frenchman who had not practised as well as studied Anglo-American law.

THE KNOWN IN DANTE'S LIFE.

La Divina Commedia di Dante Alighieri, da G. A. Scartazzini. Volume quarto. Prolegomeni della Divina Commedia. Leipzig: F. A. Brockhaus. 1890.

In 1875, in the preface to the second volume of his edition of the 'Divina Commedia,' Dr. Scartazzini announced that he should complete his elaborate commentary by a fourth volume, containing such historical and critical matter as would sum up and complete the results of his long and painstaking labors as annotator. It would, he hoped, be ready in 1878. The patient investigation of many students during the fifteen years which have passed since the present volume was thus announced has changed in many respects our ideas about Dante. The romantic history of Dante's life, the *bel romanzo*, as Scartazzini calls it, with its embassies to various powers, with its frequent journeys to other countries, its years of university training at the centres of learning, with its important part in the political, philosophical, and literary life of the time — all this has been put to the test of the severest critical study. Instead of knowing almost as much about Dante as about Dryden or Gray, we have learned that we really know very little of his outward life—very few facts that could show us how he looked, what he did, what he said, or what were the incidents, important or trivial, which made up his relations with the life of his time. The work of Dante scholars, a work now more organized than ever before, has aimed in the last few years at reducing this fine romance of Dante's supposed life to a sound basis of historical fact, in order that with these facts—even if, indeed, they be few—thoroughly in mind, we may go on, without false conceptions at the outset, to understand that which is of much more importance—Dante's inner life, his life as shown in his works.

To the reader of the 'Divine Comedy,' then, who is anxious to have no misconception of the facts of Dante's life, Scartazzini's 'Prolegomeni' has a peculiar interest, as the work of a man who for a quarter of a century has studied with almost superstitious reverence every scrap of writing which concerns Dante's life and works, and to whose accuracy and enormous capacity for labor we owe the best modern commentary on the 'Divina Commedia.' The second division of the work in hand need not detain us here. It treats cursorily of the language and literature of the *trecento*, and then, at greater length and one by one, discusses various writings of Dante, their main characteristics, and the dates at which they were written, adding a bibliography of the chief books bearing on them. In short, this second part is in general equivalent to the corresponding part of the author's small hand-book, published by Hoepli in 1883 and translated by Mr. Davidson in 1887. The first part of the 'Prolegomeni,' however, calls for more careful attention: it treats definitely of the life of Dante. What, then, has Scartazzini to say to us after his twenty-five years of study, and how do the results which he has reached compare with those of other workers in the same field?

According to Scartazzini the ascertained historical facts in the life of Dante Alighieri about which there is no doubt are few in number. The son of Alighiero and his second wife, a certain Bella, he was born in Florence, in May or June, 1265, of a Guelph family, whether noble or of the people we cannot tell. Dante had a brother and a sister, but we know nothing more of them, or indeed of their parents, than that they existed. As to the events of Dante's early life we are scarcely wiser. He was at the Battle of Campaldino, June 11, 1289, if we may believe the testimony of Bruni or trust to Dante's hint in the "Purgatorio" (v. 91), and at the siege of Caprona later in the same year. At some time before his exile—certainly not after 1298—he was married to Gemma Donati, by whom he had at least four children. Of her character we know nothing: whether she was a good wife or he a good husband we have—long disputes among critics to the contrary—no means of ascertaining. It is not even certain whether, after January, 1302, he ever saw her again.

Dante held no political office before 1295 or 1296. In 1296, in obedience to the Ordinances of Justice, whereby no one could hold office unless enrolled in one of the Seven Arts, he entered his name among the doctors and apothecaries. On December 10, 1296, and March 14, 1297, he is recorded as speaking in the Councils of the One Hundred. In 1299, he was ambassador to San Gemignano on the part of the republic of Florence.* Of the other thirteen embassies of Dante reported by Filelfo we have no proof whatever. From June 15 to August 15, 1300, he held the office of Prior, an honor by no means extraordinary. The quarrel which led to the banishment of the leaders of both the Blacks and the Whites occurred in December, four months after Dante had left office. It is not true, then, that he could have had a part in the sentence of banishment which caused the death of his chief friend, Guido Cavalcanti.† In April, 1301, almost a year after he had finished his term of service as Prior, Dante appears again in the public records, this time as supervisor of certain improvements which were made in the Via di San Procolo. In the same year he voted, April 14, in the Consiglio delle Capitudini, and on June 19 and September 13 we find him recorded as taking part (*consuluit*) in the proceedings of the Council of the Hundred. These few bare facts are really all that we know of Dante's political services to the republic of Florence.

Shortly after Charles of Valois entered Florence, and the Guelphs came into power again, the new Podestà, Cante de' Gabrielli, in a decree of January 27, 1302, declared Dante guilty of barratry and other crimes, and condemned him to a fine of five hundred florins, banishment for two years, and the entire loss of civic rights. Forty days afterwards, March 10, a further decree declared that Dante (and fourteen others) had not obeyed the decree of January 10, and condemned him to death by burning if he ever came into the power of the State. The reasons for Dante's exile were probably these. He had opposed the coming of Charles of Valois and the intervention of the Pope in the affairs of Florence. He was an enemy of the party of the Blacks, *fidelium devotorum sancte Romane Ecclesie*. He had, moreover, for several years repeatedly shown himself unfriendly to the Guelph policy. In 1296, 1297, and again in 1301, he had perhaps opposed—in vain—a bill granting money to aid Charles II. of Naples in subduing the rebellious Sicilians. In 1301 he had certainly voted *nihil fiat* on a request from Boniface for a hundred soldiers. No wonder that the Blacks discovered that the large amount of money which must necessarily have passed through his hands as Supervisor of Roads, paved an easy way to a charge of theft.

It is in the highest degree improbable, Scartazzini thinks, that Dante was the Ambassador of the Whites at Rome in the autumn of 1301. Villani, who would have been certain to know of such an event, does not mention it, and his statements seem even to preclude it. The Pope was not at Rome at that time, but at Anagni, and Dante, of all men, one would suppose, was the one least likely to be sent to him. Dante probably joined the band of exiles, whose numbers were rapidly increasing. He was at least with them, as his signature shows, at San Godenza, at the foot of the Apennines, not far from Florence, June 8, 1302, when they entered into a certain agreement of indemnity with the Ubaldini. Some time later, displeased with his company, he left the allies. In March, 1304, or at some time previous, he was in Verona at the court of Bartolommeo della Scala. August 27, 1306, he was living in Padua, as his signature to a notary's deed shows. October 6 of the same year we find him in Sarzana, in Lunigiana, as procurator of Franceschino Malaspina. Either before or after this he is said on good authority to have studied in Bologna and in Paris. He may, indeed, have been in Paris when he heard of Henry the Seventh's expedition into Italy. Late in 1310 or early in 1311, he sent forth, from what place we do not know, his celebrated letter to the Princes and Peoples of Italy. March 31, 1311, from somewhere in Tuscany near the source of the Arno, he sent to the Florentines his tremendous letter of invective, the only result of which was a new sentence of condemnation against him. April 16, 1311, he was at the same place, and writing a letter of humble remonstrance and earnest advice to the Emperor, whom, as he hints, he had met shortly before.

From 1311 on, Dante's movements are even more indefinite. It is said that in March, 1314, he was in Venice, ambassador of Guido No-

*This Scartazzini denies, declaring that the document which is supposed to prove the embassy is not now to be found and probably never existed. It has, however, recently been discovered and is published in the *Rivista Critica*, ii., 29 (Jan., 1885.)

†Here Scartazzini's zeal for clearing away mere rumor from the record of Dante's life has led him astray. Guido Cavalcanti, he says (founding his statement on an error of Villani's), was banished in December, 1300, not in June. But Cavalcanti died in August, 1300, as Del Lungo has proved by the record in the *Obituario di S. Reparata*. See Del Lungo, 'Dino Compagni,' vol. ii., pp. 98, 110, and 114.

vello da Polenta of Ravenna to congratulate the new Doge. But the letter, written in the vernacular to his master, which alone gives us this information, was first known to exist only as late as 1547, and is at best of doubtful authenticity; for, in 1314, there was no new Doge at Venice, and Guido was not then Lord of Ravenna. Our only knowledge about Dante's movements during this period is that in 1315 or 1316 he wrote a letter to the Italian cardinals, and that we have an indignant letter, perhaps authentic, addressed by him in 1316 or 1317 to a relative at Florence in reply to a proposal that he should make submission and return to that city. About 1315 he was certainly in Lucca. He may, too, have passed some time at the court of Can Grande at Verona. At any rate, not earlier than 1316 he came, at the invitation of Guido da Polenta, to Ravenna, where, with at least two of his children, he spent the remaining years before his death on September 14 1321.

To such a barren narrative does Scartazzini's close criticism narrow down the *bel romanzo*. His method, the reader will observe, is to doubt at every point, to admit nothing as a fact in Dante's life of which there is not tangible proof. In the application of this method, in which he follows the brilliant Prof. Bartoli, Scartazzini, as we have seen, sometimes goes too far. Doubting and testing at every point, he sometimes doubts too subtly, and argues himself into finding an obstacle to belief when none really exists.

Scartazzini's critical examination of the facts of Dante's life is undoubtedly valuable. He clears away error and unconscious prejudice of mind; he stimulates research and rigorous examination; in a few pages, without wandering into unnecessary excursions—the besetting sin of most books of this kind—he indicates, usually with a statement of his own solution, all the problems which the student of the historical facts of Dante's life must at one time or another consider. On the other hand, this volume of 'Prolegomeni' is a disappointing one. Scartazzini is at his best as a compiler. As an acute and learned compiler he has produced the best commentary on the 'Divine Comedy.' In the part of the 'Prolegomeni' which we have taken up, he has shown his best characteristics—a skilful compiler's acuteness and learning, with the strict honesty of the trained investigator. As a critic of life and of literature, however, Scartazzini is distinctly inferior. When he comes to Dante's real life, his inner life, and to the consideration and explanation of Dante's works, one must reluctantly admit that he is dull, unsympathetic, and unsatisfactory.

BOOKS OF THE WEEK.

RED-LETTER TOURS.

SPAIN in the autumn, *INDIA* for the winter. Number limited to twelve. Six vacancies. Address RED-LETTER, P. O. Box 388, Lowell, Mass.

Coast of Maine.

CAPE ROSIER.

The lands of the "Cape Rosier Associates" on Penobscot Bay, 50 miles nearer Boston and the West than Bar Harbor, Mt. Desert, are offered for sale in parcels of five and ten acres and upwards. These lands comprise over ten miles of almost continuous shore-frontage in one of the boldest and most beautiful sections on the coast, twelve hours' journey from Boston. They front upon fine harbors, have beautiful rocky shores, beaches, woods, and mountain views. The drives along the shores and among the hills are very varied and beautiful. New wharves have been built, and new connections with daily trains and steamboats established. In these lands is offered an exceptional opportunity to purchase for very small sums fine and perfectly protected seashore estates. The lands will not be sold for speculation or in small lots.

Exhaustion.

HORSFORD'S
ACID PHOSPHATE.

The phosphates of the system are consumed with every effort, and exhaustion usually indicates a lack of supply. The Acid Phosphate supplies the phosphates, thereby relieving exhaustion and increasing the capacity for labor. Pleasant to the taste.

Dr. A. N. KROUT, Van Wert, O., says: "Decidedly beneficial in nervous exhaustion."

Dr. S. T. NEWMAN, St. Louis, Mo., says:

"A remedy of great service in many forms of exhaustion."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION: Be sure the word "Horsford's" is printed on the label. All others are spurious. Never sold in bulk.

OF SPECIAL INTEREST.

BEYOND THE BOURNE: Reports of a Traveller Returned from "The Undiscovered Country." By AMOS K. FISKE, Author of "Midnight Talks at the Club." 16mo, vellum cloth, gilt top, $1.00.

This account of "three days in the other world" has all the fascination of the best type of speculations as to the future life. It is ingenious, philosophical, lucid in style, candid in spirit, and breathes throughout a profound and hopeful belief in the immanent Deity.

HENRY WARD BEECHER: A Study of his Personality, Career, and Influence in Public Affairs. By JOHN R. HOWARD. *Three Portraits.* 8vo, vellum cloth, with label, 75 cents. Originally published as Introduction to Beecher's "Patriotic Addresses,' now separately issued to provide a concise and comprehensive Beecher biography at a low price.

"Gives a well-proportioned view of Beecher's whole career, and is enriched with many personal reminiscences, anecdotes, and letters."—*Brooklyn Times.*

"Written from the point of view of close personal intimacy, but with discrimination."—*The Nation.*

JUGGERNAUT: A Veiled Record. A Novel. By GEO. CARY EGGLESTON and DOLORES MARBOURG. Cloth, with Hindu design in gold by IBSEN, $1.25.

"No tangle of plot, but a keen, irresistible story of two lives, swift, straight, and brilliant as a sword-thrust—and as terrible."—*Howard's Column in New York Press.*

"They have brought out in a fierce white light the inevitable moral ruin which this apparently respectable pursuit, [unregulated ambition and desire for money as a means of power] carries with it. . . . Will be read for its tragic pathos. The moral of it needs no emphasis; it lies on the very surface of the tragedy."—*Christian Union.*

MURVALE EASTMAN: Christian Socialist, A Novel. By ALBION W. TOURGÉE. Vellum cloth, decorated, $1.25.

"Judge Tourgée has struck many valiant and trenchant blows in the cause of the oppressed, but even his 'Fool's Errand' will not equal in strength, scope, and thrilling interest as a story this powerfully elucidated illustration of the Christ-given principle of socialism."—*Boston Home Journal.*

FORDS, HOWARD & HULBERT, 30 Lafayette Place, New York

THE JOHNS HOPKINS PRESS.

NOW READY.

STATE AND FEDERAL GOVERNMENT IN SWITZERLAND.

By JOHN MARTIN VINCENT, Ph.D.

Librarian and Instructor in the Department of History and Politics, Johns Hopkins University.

250 pp. 8vo, cloth. Price, $1.50.

"Of all the foreign federal constitutions now in operation, the most important for comparison with the Constitution of the United States is that of Switzerland. Switzerland is composed of the most ancient groups of republics which still retain their republican institutions; it is also the oldest confederation now in existence; in many respects it bears a strong resemblance in government to the United States, and many problems common to both federations have been worked out in Switzerland in a manner most instructive to Americans."

Switzerland is of particular interest just now, for on August 1, 1891, the six hundredth anniversary of the republic will be celebrated. A sketch of its constitutional history during that period will be found in this volume.

Orders should be addressed to
THE JOHNS HOPKINS PRESS,

The Nation.

NEW YORK, THURSDAY, JUNE 25, 1891.

The Week.

THE important feature of the Ohio Republican Convention was not its nomination for the Governorship which is to be filled next fall, but its attitude toward the United States Senatorship that will be disposed of by the Legislature then to be chosen. The selection of Maj. McKinley as the candidate for Governor was inevitable, his championship of the Tariff Bill passed by the last Congress rendering his nomination a necessity of the situation. It was never a question whether he was likely to make the best run; the Convention was bound to make him the head of the State ticket. There ought to have been as little room for question about the Senatorship. In ripe experience as a public man, in proved qualifications for the Senatorship, in obvious fitness to render the state effective service during the next few years in that office, no Ohio Republican is for a moment to be thought of in comparison with John Sherman. If the sober judgment of members of the party throughout the country could be pronounced, it would prove all but unanimous in the opinion that the best interests of the nation dictate his re-election. Notwithstanding this, the veteran leader found the opposition to him in his own party so strong that he was forced to decline the position of presiding officer of the Convention, which he would have liked, and even to withdraw his name as a candidate for the Senatorship, "except on the voluntary tender of the office to him after the election of the next General Assembly." Except for this complete surrender he would have been subjected to public humiliation by the advocates of ex-Gov. Foraker, who are bent upon putting that remarkable political character in Mr. Sherman's place.

A State campaign ought to turn on State issues, and there are plenty of such issues in Ohio this year. The Republican platform, indeed, devotes some space to them, but they are bound to play a secondary part in the contest. The attention of the people is engrossed with the bearing of the election upon national affairs, and their verdict will be governed by their views upon questions of Federal, rather than State, administration. In this respect the canvass of 1891 in Ohio bears a striking resemblance to that of 1875, when Rutherford B. Hayes ran against William Allen for Governor. If the Republican nomination of Mr. McKinley is followed by the renomination of Gov. Campbell as the Democratic candidate, as now seems probable, the success of either will assure the State a good Executive, and the contest will be more than ever one of national policies. The chances undoubtedly favor the Republicans. Ohio has never failed to go Republican in a Presidential election, and when a State canvass is made to assume a national aspect, as in 1875, the Republicans are always likely to come out ahead. Moreover, it must be remembered that the "tidal wave" of 1890 was felt less in Ohio than in any other State. While Pennsylvania on one side elected a Democratic Governor, and Indiana on the other a Democratic Secretary of State, Ohio gave about 11,000 plurality to the Republican candidate for Secretary of State, and the Democrats secured a majority of the Representatives in Congress only by reason of a most outrageous gerrymander. Finally, the Republican managers throughout the country recognize the disastrous effect which the defeat of McKinley would have upon the party, and will concentrate all their resources upon the State—and their resources are greater than those of the Democrats.

The value and usefulness of courage in politics have been shown in a very striking way in the campaign which has been in progress in Mississippi during the past three months. The sub-treasury scheme of the Farmers' Alliance obtained a very strong foothold among the farmers of the State, when it was put forth by the Alliance during the winter and spring. The Alliance made the scheme the chief issue in the campaign for the election of a Legislature which was to choose a United States Senator to succeed Senator George. It sent out letters to all candidates for the Senatorship, including Mr. George, asking for their views about the scheme. Mr. George did not flinch from the issue, but met it squarely in a long letter, in which he exposed with great clearness and force the fallacies of the project. He followed this up with other letters and speeches, and for two months or more he has been conducting a genuine campaign of education with the sub-treasury scheme as a text. His chief opponent has been Maj. Ethan Barksdale, who, from the outset, took a position exactly opposite to the courageous one taken by Mr. George, expressing complete approval of the views of the Alliance, and advocating the sub-treasury plan with arguments worthy of the wildest disciple of cheap money. It has been revealed during the past few days that in taking this course Barksdale turned his back upon opinions which he, as an editor, expressed only a few years ago, and some of his editorial articles of that period have been reproduced in which he denounced the sub-treasury plan as the "most stupendous centralization project that has been conceived by the most extreme consolidationist," and declared that the "power of corruption that it would confer, the patronage that it would build up, the swarms of officeholders and pensioners that it would inflict upon the country, is a picture which the imagination grows weary in attempting to paint." Barksdale's cause was on the wane before these revelations were made, and is now regarded as hopeless.

Gov. Pattison has signed the new ballot act for Pennsylvania, and it is therefore a law. It will go into effect in March, 1892, and the next Presidential election will be held under its provisions. It is, as we have pointed out, a very defective measure, and most unfair in its provisions relating to independent and third-party nominations. It will, however, give the State a secret, official ballot, and consequently will prevent intimidation, bribery, and many other of the familiar devices practised under the old system. Still, we think the Governor might justifiably have vetoed the measure, for our experience in New York has shown that in many respects a defective ballot-reform law is worse than none.

Although the Illinois Legislature refused to pass a general woman-suffrage bill, it enacted a law giving the sex the right to vote in school elections. Representative Parsons, says a correspondent of the *Woman's Journal*, "pointed out the success of women as teachers and county superintendents, and paid a glowing tribute to Miss Mary Allen West as the best superintendent of schools in the West. He made an eloquent plea for the right of women to vote for the school boards that were to employ teachers for their children." The bill passed the House by a vote of 82 to 44. So far as appears, there was no opposition to it from the "Women Remonstrants" who protested against a general bill. Every such partial measure undoubtedly helps to hasten the coming of universal suffrage, in no way more than by the influence of its successful working in overcoming the opposition and indifference of women themselves.

The opening of the new Federal Court of Appeal in this district last week was, we were glad to see, marked by solemnity suited to the occasion; for the creation of a Court of Appeal to share the labors of the Supreme Court is an occasion of some solemnity in the judicial history of the Government, and it was well to surround it with some ceremonial. It was pleasant, for instance, to see the judges in silk gowns, in this city, which has suffered so much from want of more external dignity and formality in its courts of justice. The theory that costume is a matter of no importance has long held its ground all over the country, with most unfortunate effects on the manners of the male sex, and its effects have been nowhere more perceptible than in courts of law. The upward progress of the race from mere savagery has been in no outward sign so distinctly marked as in dress, and to ignore its importance is to ignore the relation of the eye to the imagination. In every civilized country everybody, in spite of himself, associates what a man wears, in some degree at least, with his character. He considers certain costumes ap-

propriate to certain callings and certain mental and moral characteristics, and he makes inferences from dress as to these characteristics. In other words, he believes, consciously or unconsciously, in the existence of suitability in clothing. A minister dressed like a sporting man would offend everybody, and a judge of a court of record produces the same effect, though in a less degree. A minister in a gown in the pulpit, too, is undoubtedly a more impressive personage and a greater authority, even to the most cynical agnostic, than a minister in an overcoat—something we have ourselves seen. A judge in a silk gown, for similar reasons, is, both to the audience in his court and to himself, a different man from a judge in a black velvet sack and yellow waistcoat—something we have also seen.

The *Christian Union* gives a supplementary explanation of its view that a minister may honorably remain in the service of a denomination, though rejecting important articles of the creed. It now says that such a course is legitimate only when the minister frankly and fearlessly avows his dissent, and seems to think that, as long as no secret is made of heretical opinions, there is no impropriety in continuing in the service of the sect to which they are repugnant. Now, we have no wish to express a judgment on particular cases, but we think the essentially immoral nature of the general position is clear from a single consideration. Suppose a young candidate for the ministry were "frankly and fearlessly to avow his dissent" from leading articles of belief in any church; it is perfectly certain that he would never be allowed to enter the ministry of that church. He goes in only on condition of agreement, and there is a tacit understanding, in some cases there is an express understanding, that he will stay in no longer than he continues to agree with the creed he is engaged to expound and defend. How, then, is it possible to relieve a man, in the position where the *Christian Union* would place him, of the appearance, at least, of having obtained his ministerial standing under false pretences? With his present views avowed, he could not possibly obtain that standing in the first instance. What moral right has he to throw the burden of initiating a prosecution upon his church, to force him to relinquish a position accorded him on an understanding which he has violated?

A few additional letters and telegrams which passed between the Comptroller of the Currency, Mr. Lacey, and the Bank Examiner, Mr. Drew, in reference to the affairs of the Keystone Bank, are published in Philadelphia. There is not much fresh information in them except two casual references to members of the Wanamaker family. In a confidential telegram sent by Mr. Lacey to Mr. Drew, on the date following the closing of the bank, occurs this instruction: "Call at southeast corner of Eighteenth and Spruce Streets at eight o'clock this evening and give Mr. Thomas B. Wanamaker close estimates of assets and liabilities." In a letter to Mr. Lacey, two days later, Mr. Drew says:

> "The District Attorney showed me confidentially a despatch from the United States Attorney-General at Washington, directing the District Attorney to take no action in Mr. Marsh's case for the present. I do not know what that comes from precisely, but I thought I ought to inform you of the matter. Mr. W. has consented to return the uncancelled old certificates of stock for a consideration from Mrs. Lucas, as I learn, and I expect to have them in my possession to-morrow."

The Mr. W. referred to is the good John Wanamaker, who, according to his own confession, had been trying to get $100,000 or more for those "old certificates of stock" before the bank failed (though he had been told by Marsh that they were fraudulent) and $50,000 after the bank had been closed. He has declared that he turned them over to the Lucas estate for nothing; Drew says in the above letter that Mr. W. returned them "for a consideration." This is an interesting point for further inquiry. Mr. W.'s memory played him false about delaying the appointment of a receiver, and it may have played him false about this stock. It is much to be regretted that Mrs. Lucas is in Europe and cannot give her recollection of the affair.

There appears to be no doubt that in designing the *Gloriana*, the famous Rhode Island boat-builder Herreshoff has presented the world with a yacht of a distinctly new type. She is a keel boat, not a centre-board, yet she has demonstrated her ability to outsail the swiftest centre-boards which American ingenuity has been able to devise. In her presence the old gibe at American fast yachts as mere "skimming-dishes" must be withdrawn from further service. She is a cutter on the English model, but with entirely novel additions. She is cut away in front even more than the *Thistle* was, but instead of the *Thistle's* sharp bows, she has blunt bows, resembling the head of a shark. The line of the keel is carried straight up till it meets the curve of the deck. There is no curve at all at the forefoot. In explaining these bows, which are an entirely new departure in yacht-building, Mr. Herreshoff said, long before his yacht had touched water, when surprise was expressed at the hard curves of the load-water line: "That makes very little difference. The water does not go that way." His theory was that most of the water displaced goes underneath the boat, not around the sides, and hence he made the curves below the water line as easy as possible. The five trials which the *Gloriana* has had, in all kinds of weather, have demonstrated the wisdom of his view. The yacht sailed away from all competitors so completely that there was almost no second in any of the races. In the heavy wind and sea of Thursday her blunt nose rode easily over the waves, while other yachts plunged their sharp ones into them. Her remarkable achievements will not be overlooked by English yachtsmen.

The annual report of the Austro-Hungarian Consul-General in this city for the fiscal year 1889 to 1890 is a document replete with valuable statistics concerning the commercial relations of the United States and Austria-Hungary. Curiously enough, even its tables of the immigration from the various provinces of the Empire furnish only an approximate total, owing to the rule of the Immigration Office at this port, according to which the Polish-speaking immigrants from Galicia and Russian Poland are classed as "Poles," and not credited to Austria and Russia respectively. Until recently, the Poles of Posen were ranked with them, but a remonstrance of the German Government has, we believe, resulted in their classification as German subjects. Exclusive of Galicians and some Polish-speaking Silesians, the emigration from Austria-Hungary during the fiscal year ending June 30, 1890, amounted to 56,199 persons, the two countries outranking Austria being Great Britain and Ireland, with 122,754 immigrants, and Germany, with 92,427. The total value of the imports from the Empire was $9,331,000, the articles highest in the list being buttons, $1,679,000, or 52 per cent. of the total importation of buttons from all countries; beet sugar, $1,577,000, as against $16,031,000 from Germany; prunes, $857,000, or 48 per cent. of the importation from all countries—a falling off of one-half since 1884; porcelain and earthenware $543,000, as against $3,951,000 from Great Britain, and $1,165,000 from France; linen goods, $519,000, as against $13,120,000 from Great Britain, and $1,941,000 from Germany; chemicals, $385,000, as against $2,918,000 from Great Britain, $2,718,000 from Germany, $2,220,000 from Italy, etc.; silks, $338,000, as against $15,000,000 from France and $10,200,000 from Germany; cotton goods, $265,000, as against $11,886,000 from Great Britain, $8,440,000 from Germany, and $6,222,000 from Switzerland; fans (other than palm-leaf fans), $200,000, or 42 per cent. of the importation from all countries; jewelry, $187,000, as against $635,000 from France and $291,000 from Germany.

In glassware Austria still retains its supremacy, the imports being $638,000, or 32 per cent. of the total importation of this article; but whereas the imports from Germany, France, England, and Belgium are constantly increasing, those from Austria-Hungary are declining. Similarly, the importation of woollens, in spite of the well-known excellence of some of the Moravian and Bohemian cloths, has fallen from $282,000 in 1887 to $142,000—an absolutely insignificant figure as contrasted with the $29,000,000 from Great Britain and $13,500,000 each from Germany and France. The formerly flourishing glove industry of Austria now furnishes but $171,000 to the list of imports, Germany, with $2,078,000, having become an almost successful rival of France, whose figures are $2,348,000; and even Belgium, $362,000, Italy, $286,000, and Great Britain, $252,000, have

already outstripped Austria. The importation of pearl buttons, which furnished the second largest item in the above list, has, since the passage of the McKinley Bill, practically ceased, and the total importation of buttons of every kind will probably not reach $150,000 for the coming fiscal year. It would be interesting to learn in this connection how many of the ruined Vienna manufacturers of pearl buttons are now working in Newark factories in competition with American free labor. A pertinent inquiry into the genuineness of the "Pilsen" beer so extensively—and expensively—sold all over the United States, is suggested by the smallness of the total importation of beer in barrels, only $29,670. The votaries of Gambrinus will find food for melancholy reflection in these figures, as will those of Bacchus in the $73,780 credited to the total importation of Austrian and Hungarian wines, including Tokays. The Consul-General very properly lays stress on the need of supplying the American market with "healthful" Hungarian wines.

Cuba is in a state of high exasperation with Spain just now over the proposal of the Minister for the Colonies to lay a tax upon sugar plantations. This is the neat and characteristically Spanish way of nullifying the advantage given Cuban sugar-growers by the opening of the ports of the United States to their product. Still, it must be said, there is reason in Minister Fabié's position. If you have insisted upon reductions in the tariff rates on goods coming from the United States, he says to the Cubans, in order to secure the continuance of the abolition of duties on your sugar in the latter country, you must give me a chance to make up the resulting deficiency somewhere, and how can I do it more justly than by taxing the men who are to reap the greatest advantage from the treaty? But it does not strike the Cuban mind in that way. Telegrams of urgent and almost fierce protest have been sent from the leading mercantile and financial associations of the Island, and the prospect of a new and burdensome tax has entirely destroyed the good impression made by the home Government's complaisance in acceding to Cuba's wishes in the matter of the treaty with this country. Certainly if the Cubans take counsel of experience, they may be sure that all they have to do is to make their protests angry enough, and the obnoxious tax will be dropped. For ten years, now, it has been a continual demand on the part of Cuba, and a continual yielding on the part of Spain—though the yielding has usually been too late and grudging to have a conciliatory effect. The one great cause of complaint remaining was the Spanish tariff on tobacco; this is almost forgotten in the rage at the proposed new tax on real estate.

One of the most important projects of the late Secretary of the Mexican Treasury was an inter-State conference for the purpose of arriving at a plan to do away with the antiquated system of internal custom-houses, and to mitigate the enormities of direct taxation on trade practised by States and municipalities. The delegates met at the end of last November, and the Convention referred all the matters in debate to a committee. The latter's report was made public last April, and is expected to receive the approval of the conference, and afterwards of the States and the Federal Congress. The report deals with the old abuses in a sweeping way. It abolishes all domestic custom-houses, and all taxes, direct or indirect, upon internal commerce. Then it vests the power of levying all direct internal taxes in the Federal Government, and provides for an equitable distribution among the States of certain parts of the revenue thus obtained. Altogether the results of this conference, with the prospect of their speedy acceptance by the States and the nation, mark a prodigious step in advance for Mexican commercial interests.

The general dissatisfaction with the attitude of the Administration in Brazil towards the new Constitution, of which we lately spoke, has led to the formation of a solidified party of the Opposition, styling itself the "Republican Constitutional Party." The new organization launched a declaration of principles and aims on May 1, signed by high officers of the army and navy, ex-Ministers and ex-Governors of States, and many members of the two houses of Congress. The idea seems to be to group as many of the old Republicans as possible, together with all sincere supporters of the new form of government who are offended by the present reactionary Cabinet, in order to bring about an agitation which will compel the Executive to show greater respect to the Constitution. The declaration of the ends to be striven for by the new party conveys by implication the complaints brought against the elements in power. It enumerates among the results aimed at: "The restoration of the provisions of the Constitution plainly violated, full autonomy for the States, intellectual liberty and freedom of labor, the most complete guarantee of untrammelled elections, measures of the strictest economy for the reëstablishment of credit, the equilibrium of the budget, the quickening of the productive forces of the country, and the improvement of the moral and physical conditions of the working classes." The late reorganization of the Cabinet, with the bestowal of the finance portfolio upon an old Republican, Gov. Braziliense, is said to be a concession to the new party, already extorted from the fears of the Administration.

Our withers are not altogether unwrung these days in the matter of banking scandals, but the report on the conduct of the National Bank of the Argentine Republic, recently made public, probably shows a worse state of things than will appear even in Philadelphia. At any rate it brings out in a clear light the fearful extent of debauchery among Argentine public officials, and reveals something of the wild and dishonest financial methods that finally wrecked the public credit. The Investigating Committee found proofs of criminal imprudence in the loan of money to irresponsible firms and individuals, but uncovered the worst scandals when it explored the relations of the bank to the Government. "The bank and the Government went hand in hand." Whatever modifications in the banking laws were desired were easily obtained, but only on condition of a close alliance with the members of the Administration. "The results of this intimacy were loans to members of the Government and to all sorts of politicians whose paper was worthless." Then there was the headlong rush of the bank into speculation, and the lending of its name to push the most inflated schemes. Vast sums were lost of which no trace remains, and many debts are marked "paid" on the books though the loans are still outstanding. "In a word," says the report, "the situation can be summed up as follows: Dishonest management of the bank, complete disorder in accounts, free disposal of the bank's funds by persons with no authority to touch them, acceptance of salaries by employees twenty or thirty times as great as those authorized by the directors."

The recognition of the Chilian Congressionalists as belligerents by Bolivia will greatly increase their facilities for obtaining supplies of one sort or another, and the refusal of the French Government to permit Balmaceda to purchase and fit out ships of war in France is an example which will probably be followed by all the other maritime Powers, saves the Junta from what would be a great danger, and is really as useful as formal recognition would be. Their course, too, will be morally aided by the performances of Balmaceda's "Congress," which has been arming him with powers that convert him into a despot of the Hippolyte type. There is something comic in their going through the form of passing acts for this purpose, because he has formally announced that when he disapproves of what Congress does, it is his right and duty to disperse it or lock it up. He asserted this right against the last or Constitutional Congress, and *à fortiori* he would assert it against the present little private Congress of his own, of which he ordered the election since the fighting began. He is as grotesque a specimen of the South American dictator as we have ever had, but it must be admitted that the Congressionalists must bear part of the shame and discredit of him, for they have never explained how he came to be elected President in a country in which Presidential nominations are still made, on our original American plan, by a small coterie of leading men, or at least leading families. He must before his nomination have given some indication of the kind of person he was. The Congressionalists are being badly served, too, in the matter of spreading information. Although they are seeking foreign aid and sympathy, they are doing very little to influence American or European opinion through news of the situation.

SECRETARY FOSTER'S SILVER RÈGIME.

SECRETARY FOSTER'S speech read to the Ohio Republican Convention shows that he means to use the discretion given him by the act of 1890 to coin all the silver he can lay hands on. He said in the speech:

"For nearly a year since, we have been buying 4,500,000 ounces of silver per month, paying for it with Treasury notes, and have and will coin 2,000,000 ounces per month until the 1st of July next. After that it is *discretionary* with the Secretary of the Treasury as to how much will be coined. Since the Allison Bill of 1878 was passed, we have coined $402,873,158, and this whole sum is now in active circulation, mainly in the form of its paper equivalent, the silver certificate. Yet our gold and silver coins and their paper representatives have been maintained at equal purchasing value, and I do not see the slightest danger, under the present policy, of not being able to continue the existing status between the two metals."

It was the general understanding of conservative people when the Silver Coinage Act of 1890 was passed, that the following section was a sort of saving clause, which would prevent a silver deluge:

"Sec. 3. That the Secretary of the Treasury shall each month coin 2,000,000 ounces of silver bullion purchased under the provisions of this act into standard silver dollars until the 1st day of July, 1891, and after that time he shall coin of the silver bullion purchased under the provisions of this act as much as may be necessary to provide for the redemption of the Treasury notes herein provided for; and any gain or seigniorage arising from such coinage shall be accounted for and paid into the Treasury."

It was supposed that the Secretary would so construe his discretion as to give us the smallest possible addition to the existing volume of silver. If Mr. Windom had lived, this expectation would doubtless have been justified. But it would appear that his successor takes a large view of the nature of his discretion, and means to find in the term "necessary to provide for the Treasury notes herein provided for" the means of making still larger additions to our silver certificates than we have been making under the old law. That is to say, he may construe the term "necessary" in such a way as to authorize him to issue more certificates than the exact amount of silver purchased from month to month, on some pretext satisfactory to himself, relying on the silver passion of the next Congress to prevent his being called to account for it.

We should receive this report with more incredulity if we felt sure that we knew exactly what Mr. Foster's notions about finance were. He is, it is true, opposed to unlimited free coinage, and warns his party against it in the speech which lies before us. But he manages at the end of his warnings to throw in the following sneer at those who feared that the Allison Bill of 1878 was the beginning of an attack on the gold standard: "I do not propose to engage in prophecy, or undertake to predict what would happen if this country were to adopt unlimited free coinage. We had many prophets who foretold that gold would soon be at a premium when, in 1878, the Allison Bill, providing for the coinage of $2,000,000 per month, was passed, thus placing us on a silver basis. We coined $2,000,000 per month up to August 14, 1890."

Now, does he know, or does he not, why the Allison Bill did not create a premium on gold? This is a very important question. He may think that it was because we needed the silver, and therefore readily absorbed it. But if he thinks it was because the silver dollars are accepted as being "as good as gold" by the Government, the sneer at the gold prophets is simply silly. Silver, as long as it is treated as gold by the Treasury, can hardly put a premium on gold or drive it out of the country.

Another passage in the Ohio speech suggests other questions of a similar character:

"Our gold, our silver, our gold and silver certificates, our greenbacks and Treasury notes, and our national-bank notes, are all at par with gold. With all of our silver, and with all of our paper money, we are on a gold basis, and there we will stay. To get $60,000,000 of our gold, Great Britain and other European countries paid a premium to get the yellow metal from us, thus putting their own paper money at discount so far as American gold is concerned. Hence it has come to pass that in England, which is a single gold-standard country, American gold has been at a premium over their paper money, while the United States, with the double standard, holds its silver and paper money at par with gold.'

Now, a financier who gravely tells a large body of his fellow-citizens that drafts on the gold of this country, in the ordinary course of exchange, to meet a temporary demand in Europe, puts Bank of England notes "at a discount so far as *American gold* is concerned," and that "*American gold* has been at a premium" over Bank of England notes, certainly deserves the closest kind of watching. If he knew no better than this, he can hardly be called fit to manage the finances of a great nation. If he did know better, and concocted this as an ingenious misrepresentation for political purposes, is he fit to be trusted with discretionary power to enlarge the currency? It is hardly necessary to say to such of our readers as have left school, that "the premium on American gold in English paper money" is simply the rate of exchange necessary to draw gold from any country to the Bank of England at this present juncture, and as such is as much a premium on any gold as on American gold. Gold during the past week has reached the Bank of England not only from New York, but from Natal, Bombay, and the West Indies. Why does it go to London? Because it is for the moment worth a little more in London than in the place from which it is sent. The process of drawing it to London is explained every day in the financial columns, as in the following paragraph from the *Evening Post* of Wednesday week:

"The par of sterling exchange is 4.86.6. The rate for demand sterling bills at which gold can be exported to London without loss is 4.88⅛ for bars and 4.89¼ for coin, and the rate at which it can be imported without loss 4.83¾."

When the present demand for it in London is over, we shall, if we need it here, get it back by precisely the same process—that is, offering for it a trifle above the par of exchange. If Mr. Foster were to go into any banking-house in any civilized country with this story that Bank of England notes were at a discount in American gold, he would be listened to with pity. And yet it probably depends on his judgment and discretion whether we shall or shall not be brought down to a silver standard within the next two years. He is in desperate straits just now, having both to save the party from the charge of having emptied the Treasury and to save the Treasury from having to ask for an extension from its creditors.

THE ECONOMISTS AND THE PUBLIC.

AMONG all our writers on economic subjects none commands a wider audience or is heard with more pleasure and respect than President Francis A. Walker. His clean-cut style, precision of statement, skill in the picturesque array of facts and arguments, and logical fairness in dealing with every problem he discusses, all combine to make it a pleasure to discuss a question with him even when one differs from his views. He has seldom put forth a more thought-provoking paper than his recent presidential address before the American Economic Association, which has quite recently been published in full. The address derives its greatest interest from the fact that it is a typical example of the views taken by the large majority of our professed economic teachers on the subject of their relation to current popular opinion, and thus supplies an excellent text for considering the question whether these positions are those best adapted to gain the ends which all economists have in view. He graphically describes the great interest now taken by the public in social problems, and the spirit of dissatisfaction with the existing order of things so rife among the laboring classes, the wild theories put forth under the name of "nationalism," and the attacks from the magazine and the pulpit upon every economic principle, as a rising tide of thought which threatens to overwhelm every position hitherto taken by the economists. The latter have been driven from what was once the shore, far inland, and those who refused to join in the rout now view the scene from the roofs and tree-tops in which they have had to take refuge.

So far as the ends in view are concerned, we should probably agree with the speaker in all his views—both of the nature and tendency of these movements and of the necessity of guarding ourselves against the catastrophe threatened by them. But in the practical measures to be adopted, and especially in the attitude which economists are to assume, we are unable to reconcile his views with the dictates of practical sagacity. When he sees in the ranks of "the passionate reformers" the Socialists, the nationalists, and all others "who have for the time lost all measure of difficulty, all sense of resistance, all memory of experience," "few or no perverts from a sound political economy, but only a host of as yet rather disorderly and undisciplined converts," we would inquire from what errors and to what sound doctrines they have been converted. When he says that the revolution now in progress is making every man and every woman an economist, though a pretty poor one, and that the whole nation is at school in political economy, he belittles the science of which he is so distinguished an expounder.

Among the essentials of the relation of scholar and teacher are that the scholar shall feel that he does not know and that the teacher does know. But the most prominent of these pupils are people who think they already know, or at least, if they have a modest estimate of their own knowledge, they certainly do not think that the economists know any more than they do. And how can they gain confidence in their teachers when leading expounders of the science confess that they do not know what will be its fate after the undisciplined crowd has finished its attack? We say that the science is belittled by such a view, because the superficial ideas derived from common talk are placed on a level with that discipline of the understanding, which can be acquired only by patient study and thought under the guidance of a trained teacher. We cordially agree upon the general fact that the public is to be taught and can be taught; we differ as to the spirit and nature of the teaching required. This seems to us to be clearly indicated by a careful consideration of the points in which the public need instruction.

One great difficulty in the way of the application of sound economic principles to legislation is the universal diffusion of economic theories which, if carried to their logical conclusion, would put an end to all progress, and reduce us to the condition of a tribe of savages. What these theories are can only be learned inductively from such measures, enacted or proposed, as the McKinley Bill, the exclusion of the Chinese, the oleomargarine tax, the free coinage of silver, the New York prison-labor law, the prohibition of printing notes by machinery, not to mention a score of other measures urged by organized labor as essential to the well-being of the workingman. These measures derive all their vitality from one idea which every untaught and unthinking member of an industrial community imbibes as naturally as the babe does its mother's milk—the idea that whatever comes into competition with labor by cheapening its product without corresponding consumption is an evil, and that whatever increases the demand for labor, by either consuming its product or making more labor necessary for a given consumption, is a good. The Chinese were excluded because they gathered fruit very effectively and very cheaply and consumed almost nothing. Plate-printing was prohibited because it then cost more labor to print the notes. The employment of prison labor was forbidden because it was supposed that unpaid labor was competing with honest paid labor. The McKinley Bill appeals to nothing but the bugbear of foreign competition. Oleomargarine was taxed because it was cheaper than butter. The International Copyright Bill required type to be set in this country because more work was thus given the printers to do. The cry which carried all these measures was at bottom the same that called for the destruction of the machine when the spinning-jenny commenced its operations.

Where shall we stop if we continue to listen to this cry? Stopping-place there is none short of almost total prohibition of foreign trade and new labor-saving devices. No Chinaman is so remorseless a competitor with our labor as an effective machine, which consumes nothing but the oil and coal necessary to keep it going. If there is no danger of our reaching this logical stopping-point, it is only because of the impracticability of putting these popular theories into operation. The greatest difficulty—and, therefore, our principal salvation from them—is to be found in the selfishness of mankind. The fact that the public can get their products cheaper by every improvement in production, and that the men who make these improvements can profit by their use, operates more powerfully in favor of progress than all the arguments put forth by the labor thus displaced. But how long can we count on this force? If philanthropy is to take the place of money-making, and the popular cry against competition to receive more and more favor, how long before the retrograde movement in the direction we have indicated will become irresistible? Here is clearly an opportunity for the economist to point out to the public the error of its views, to which we earnestly invite the attention of all economic teachers.

Not only does President Walker fail to see this point of difference between himself and the public he wishes to instruct, but his attitude in relation to it is the most unsatisfactory feature of his address. There is a certain weakening on every point where the economist and the public touch, which will seem to the latter a strong hint that they have only to push hard to carry their point. Most surprising of all is it to see such an authority lecturing the economists on the arbitrary and unreal character of their assumptions and their haughty and contemptuous spirit, and repeating the stale objections to the economic man of Ricardo and Mill. Nothing ever taught by the economists is so unreal as the principles of physical science taught in the institution over which he presides. To say that the building of every railroad in this country, the establishment of every factory, the opening of every mine, and the sailing of every ship was dictated by the hope on the part of the projectors of getting dividends on their capital, and by no other consideration, is a closer approximation to reality than a great majority of the elementary principles of physics. The Carnot heat-engine works without friction, has walls which are absolute conductors or absolute non-conductors at pleasure, and is in every way such a machine as no man ever did or ever could construct or realize; yet to understand its workings is the first requisite of the student of the steam-engine. The fact is, that every branch of scientific knowledge becomes unreal, in the sense in which the word is used by objectors to the Ricardian economy, in proportion as it is developed. Principles cannot be learned or even conceived except in the abstract, and the more we abstract them, the more unreal they become.

Why is it that a man of the wide intelligence of Prof. Walker, who not only accepts this unreality in every department of physical science, but would not give a degree to a student that had not mastered it, lays aside all sound views of the necessity of things when he comes to economics? We hold that the economic student who is unacquainted with the Ricardian economy can never have any better idea of the science than the student of engineering who is ignorant of thermodynamics can have of the steam-engine; and there are plenty of passages in Walker's 'Political Economy' to show that the author really holds the same view. Then why talk to this new crowd of would-be students in such slighting terms of the only system of economics they can ever have time to study? Why try to persuade them that the "practical man" is right in his contempt for the "theorist"?

A CASE OF DEVELOPMENT.

THE naturalists have made us familiar with the adaptation of organisms to their environment, and with the development under favorable conditions of strange species which begin with but a slight divergence from the usual types. The student of history and politics sometimes is able to point to analogous phenomena; but his illustrations are not often so clear and simple as to bring out effectively the working of the forces he studies. It happens that the McKinley Tariff Act supplies a case of the sort which he needs: a case where a change from the usual mode of levying duties, at first apparently of not much moment, has developed, under the favoring surroundings of unlimited protection, into a wonderfully complicated system, which betrays only to the eyes of the expert its relation to the original divergence.

We refer to the duties on woollen goods, in which a new feature appeared in 1861, and gradually developed into the extraordinary maze of the McKinley Act. We may take as a type of the whole the duty on woollen cloths, whose history will serve to indicate the general development. In the Morrill Tariff Act of 1861, the new feature first appeared: a compound duty on woollen goods, both specific and ad valorem—12 cents per pound, plus 25 per cent. The specific duty was meant merely to compensate for the duty on raw wool, which then was 3 cents per pound on the common grades of wool. It was supposed that about four pounds of wool were needed in order to make one pound of cloth. A specific duty on cloth of four times the amount of the duty on wool would therefore put the domestic manufacturer in the same position, as regards his foreign competitors, as if he got his wool free of duty. The extra duty of 25 per cent. ad valorem alone was to give real protection.

Such was the first unobtrusive change. In 1864 the new system began to expand. The duty on the class of wool chiefly used went up to 6 cents a pound; the specific duty on cloths accordingly went up to four times that amount, 24 cents a pound. The ad-valorem duty also went up, from 25 to 40 per cent.; this change being only a part of the upward movement which all duties showed in the tariff legislation of the war.

When the war was over, and there was a general disposition to overhaul the hurried financial legislation resorted to in its course, the representatives of the woollen-manufacturers came forward with a proposal which purported merely to continue the legislation of 1861, and to fix an effective protective duty of no more than 25 per cent. Their proposals were carried out in the monumental wool and woollens act of 1867, which marks a third and important stage in the development of our new species. The duty on wool had now grown—we may disregard certain details which somewhat complicate the situation—to 11½ cents a pound. Four times that amount, or 46 cents, would be the compensating duty per pound of woollen cloth. But it was suggested in 1867 that there were also duties on dyestuffs, oils, and other things used by manufacturers; wherefore the compensating duty was raised to the round sum of 50 cents per pound. Next came the ad-valorem duty, which was to yield the moderate net protection of 25 per cent. But here it was quietly pointed out that the manufacturers had to pay internal taxes, imposed during the war and still maintained in 1867, on their goods or materials, and that an extra 10 per cent. must be added to compensate for these. So the ad-valorem duty was fixed at 35 per cent., and the total duty on woollen cloths had grown to the dimensions of 50 cents per pound plus 35 per cent. ad valorem.

After 1867 the internal taxes were quickly abolished; the duties on oils and dyestuffs also disappeared almost entirely; but the woollen duties remained intact. The protectionists, notwithstanding the strong agitation for tariff reform, and notwithstanding the uncertain attitude which the Republican party then held on the tariff, managed to fend off all reductions in the woollen schedule. No change came until the general revision of 1883. Then a new feature appeared, which served still further to complicate the already complicated system, and began the development which has finally led to the wonderful and mysterious provisions of the McKinley Act. In 1883 the wool duty was somewhat reduced, to 10 cents a pound, leading naturally to some reduction in the specific duty on woollens. At the same time it was admitted that the specific duty had been unduly high on low-priced woollen goods, for which cheaper wool, or a good deal of cotton and shoddy, was used. Accordingly, the duty was reduced and also divided. On low-priced woollens, costing less than 80 cents per pound, the duty was 35 cents per pound specific (or compensating), plus 35 per cent. ad valorem. On dearer woollens, costing more than 80 cents per pound, the duty was 35 cents per pound, plus 40 per cent. ad valorem. It will be seen that the ad-valorem rate remained at 35 per cent., on dearer goods was even raised to 40 per cent. The original proposal of a net protection of only 25 per cent. had disappeared: it was no longer suited to the environment.

Last stage of all, we have the McKinley rates. Here the method of dividing the duty, begun in 1883, is carried still further. To give all the details would be wearisome; a few specimens will suffice. If goods are worth 30 cents per pound or less, the specific duty is 33 cents a pound, while the ad-valorem or protective duty is 40 per cent. On high-priced goods the specific rate goes up to 44 cents per pound, and the ad-valorem rate is as high as 50 per cent. The rates of the McKinley Act, and the mode in which they have evolved from the simple and unpretentious system of 1861, can best be shown by a tabular statement, which will serve to summarize this curious growth, and at the same time indicate the increasing rigor and complexity of the scheme at each successive stage:

Year.		Specific duty per pound.	Ad-valorem duty.
1861		12 cents.	25 per cent.
1864		24 cents.	40 per cent.
1867		50 cents.	35 per cent.
1883	On goods costing less than 80c.	35 cents.	35 per cent.
	On goods costing more than 80c.	35 cents.	40 per cent.
1890	On goods costing 30c. or less	33 cents.	40 per cent.
	On goods costing bet. 30 and 40c.	38½ cents.	40 per cent.
	On goods costing more than 40c.	44 cents.	50 per cent.

Let the reader reflect on the remarkable results to which this process of development has led. In the first place, the ad-valorem or purely protective duty has gone up to 40 per cent. on cheaper woollens, and to 50 per cent. on those of higher price; and we may add that on ready-made clothing, to which the same compound system has been applied, and on which the specific part of the duty is also higher than that on cloths, the ad-valorem duty has been made as high as 60 per cent. Who would expect these imposing rates to evolve from a modest net protection of 25 per cent.? Looking at the specific duties, the scientific inquirer will find developments even more surprising. He will find, for example, that on the second, or intermediate, class into which woollens are divided—those worth between 30 and 40 cents per pound—the specific duty is 38½ cents per pound. Now, this specific duty is compensating; it is supposed to represent merely the extra expense to which the American manufacturer is put because of the duties imposed on the wool he uses. But the foreign goods against which he is protected are supposed, by the classification and valuation of the act itself, to be worth between 30 and 40 cents only; whence it follows that the extra burden put on the American manufacturer by the wool duties must be as great as the total expense to the foreigner of manufacturing the goods entire and shipping them to this market. Such are the results of an environment of hot protection.

THE JOURNAL OF EMILY SHORE.

London, June 6, 1891.

This has been a wretched winter in London; and although the trees and flowers have now struggled into leaf and bloom, the severe weather is still loath to loose its hold on us. To an Irishman the winter has been one of political chaos and disorder. When I walk along Rotten Row, I look across at the Alexandra Hotel, and think of the brilliant company assembled there a brief twelvemonth ago at William O'Brien's wedding, when Mr. Parnell and Archbishop Croke, now so bitterly opposed, sat in the places of honor beside bride and bridegroom. All appeared unbroken love and harmony, and bright hopes regarding Ireland well founded. Now William O'Brien is in prison, separated from his wife, not even allowed to speak to his "best man" John Dillon, confined within the same walls. They are now powerless to prevent the certain ruin of many of those who, upon their promises and assurances, left their holdings and gave up their only means of support. It appears to me almost as if we were living in a different world. But fortunately there is even in addition to our own quiet hearths a world of the mind—of literature, the drama, and art—apart from politics, apart from the contentions of the hour; and in that world there occur events which often leave as lasting impressions upon us as those passing in the fierce glare of actual outward life. Such to me were the introductions, through the pages of the *Nation*, to Turgeneff, and later to Tolstoi's writings. The production of "Margaret Fleming" may cause this wintry spring to be remembered by many on your side of the Atlantic. Here, doubtless, "Ivanhoe" and "L'Enfant Prodigue" may mark it to others. By me it will be looked back to as the spring in which I first opened the 'Journal of Emily Shore,' a modest volume of 400 pages, published by Kegan Paul & Co.

Few works have ever more deeply affected me by their sweetness and simplicity, and withal their strength and beauty. "Only a woman's hair" were the words found to have been attached by Swift to a tress, presumably of Stella's. "Only a girl's journal," we may be inclined to exclaim as we take up this book; and yet, to those who read it, the impression is likely to remain permanent. The quotation on the title-page is then felt to be singularly appropriate:

> "So be it; there no shade can last
> In that deep dawn behind the tomb,
> But clear from marge to marge shall bloom
> The eternal landscape of the past."

We owe much to the editor of this little volume for admitting us within the sacred circle of the life and thoughts of Emily Shore, and for the taste with which the Journal has been edited.* The spirit with which the introduction opens pervades the succeeding pages:

"A life whose light was blown out half a century ago, and whose whole span did not complete twenty years; a girl's life, which budded, blossomed, and faded in the close shade of a quiet English country home—here, it may be said, are scarcely materials of interest for the present generation. . . . She belongs to the order of beings of whom nature makes no replica, . . . and it might be suggested that the half century which has elapsed since this record was closed adds something, not only to the impression of definiteness and uniqueness left by its truthful disclosures, but to its general present value. A voice speaking to us in such distinct living tones across so wide a gulf is a witness in some degree of that change in feeling and point of view which on a large scale makes up the history of thought."

Emily Shore was born at Bury St. Edmunds, Suffolk, in 1819, and died of consumption at Madeira in 1839, aged nineteen years and six months. Her father was a clergyman of the English Church. Doubts regarding the Thirty-

* The addition of two of her girlish compositions appears to me a mistake. Her poetry had better have been inserted as it came in suitably through the Journal. The want of an index will be felt by many.

nine Articles prevented his seeking a responsible cure. For the first twenty years of his married life he maintained his family by receiving and preparing for college five or six young men, "many of whom were of high social position and became known in the political world." The late Earl Granville was, I believe, among them. The easy and simple relations existing between the family and these pupils inspire some charming passages in the Journal:

"Emily Shore went to no high school, no college, no lectures. She passed no examinations and competed with no rivals. . . . Her teaching was that of nature and of love. . . . Her sole instructors were her parents, especially her father; but much, very much, was done by herself. She made her whole existence a happy school-room. [That it was a self-overtasked school-room most readers will believe.] It was, indeed, in a great degree to her wandering at dawn of day in the dewy woods, and her late watchings at open windows with a telescope, collecting plants, and studying the habits of birds and insects, that she owed the attack of lung disease which terminated so fatally and so soon."

She was blessed with a retentive memory and a power of rapidly acquiring knowledge, often committing to memory dates at the rate of over one hundred a day. She had an insatiable thirst for reading of the most wholesome kind. She had often on hand at once, besides regular studies, such books as Butler's 'Analogy,' 'History of India' (Mill's), Forster's 'Essays,' and Mrs. Somerville's 'Connexion.' Recovering from an accession of the disease that finally carried her off, she writes:

"I must keep up French by the reading of Lamartine. Italian I have begun. . . . 'Medea' to keep up Greek, and the 'Æneid' to keep up Latin. . . . I must begin German, which I am sighing for, and which my sisters are already learning. I am afraid I cannot make time for a sixth language, or I should learn Spanish also."

She delighted in sketching and had a singular facility in catching likenesses. In the few weeks at Madeira before her death, she collected plants, and learned to read and obtained a colloquial knowledge of Portuguese. She was constantly engaged in composition, and left behind many MSS. in writing as clear as print. With the exception of a few essays on the habits of birds in the *Penny Magazine*, it does not appear that she ever sent anything to the press. But it is not on account of her acquirements that her memory will rest with us. It will remain that of a sweet country girl, loving to all around her, tending her brothers and sisters and weaving romances for their amusement, immersed in the lives and fortunes of her pets, roaming the woods and heaths in the neighborhood of her beloved Woodbury in search of flowers, and following up song-birds. No reader is likely to forget the histories of her lark, her jay, and her jackdaw. One of the troubles of her thirteenth year was that "two of my stuffed birds are thrown away because they breed the moth." The portrait prefixed to the Journal, taken at Madeira a few weeks before her death, shows her with a stuffed bee-eater on her knee. The Journal was commenced in her twelfth year.

"Our family consists of papa, mamma, and five children. Papa is curate, during part of the year, of Mr. Cust, rector of Cockayne Hatley, a little village two miles and a half from us. We live at Potton, a little market town on the confines of Bedfordshire and Cambridgeshire. Papa takes pupils; his greatest number is six."

The last entry given is made six weeks before her release:

"I feel weaker every morning, and I suppose am beginning to sink; still, I can at times take up my pen. I have had my long back-hair cut off. Dear papa wears a chain made from it. Mamma will have one too."

The journal extended to twelve volumes in MS. If we may judge from the specimen page, about one-sixth of its total bulk is published. It takes us back into a different world indeed from that in which we are now living:

"All the mob of Potton made a great riot to celebrate the passing of the Reform Bill, and paraded the town with the most hideous yells. . . . I do not suppose that any of them understood what they were so noisy about. . . . The boys in the street threw stones at us and behaved very impudently, which my aunt attributes to reform. What an idea!"

The best conveyance to Madeira was a 460-ton West Indiaman. We are occasionally taken away from her home to London, Cambridge, Tunbridge Wells, Hastings, Ely, the New Forest, Torquay, Exeter, Southsea; and wherever we accompany her, whether visiting a university or a printing-office, a dockyard or a steamboat, we have evidence of interested and intelligent observation. There is often a touch of 'Harry and Lucy' and 'Rollo' in the fireside and tea-table conversations. The main interest centres round Potton, where the story opens, and her dear Woodbury, two miles off, where the family moved shortly after an innocent love passage in her seventeenth year is half revealed.

After losing myself in the pages of this delightful book, I desired to visit the main localities mentioned. Potton is on a railway line forty miles north of London. It is a lovely old village, for the most part unchanged since Emily Shore's time; many of the houses built, perhaps, before Shakspere was born. An artist would there find endless subjects for his pencil. The adjacent country is the perfection of English scenery—entirely different from "the green valleys and rushing rivers" so characteristic of our own dear neighbor island. Slow-moving streams wind through broad pastures, rich sweeps of cultivation, and among deep woods. Every one is well-dressed and busy. The clean, brightly paned sanded cottages are a charm in themselves. We put up at the exquisitely neat "Rose and Crown." Brook House, a large brick mansion, "without the town, in front of a little brook or ditch," shut off by a railing from the road, greensward in front, an old cedar beside it, must be exactly as when Emily Shore resided within its walls. The thirteen public houses of her time have increased to twenty-eight, but, indeed, they look innocent in comparison to city gin-palaces. A fire-brigade hall erected in commemoration of the Queen's jubilee attests that Potton is still "celebrated for its fires." A lane, or "causeway," as the inhabitants called it, between thorn hedges, led to the old church on a hillside, wonderfully picturesque, as though it had grown where it stands through the centuries. She calls it "ordinary in appearance," and says it "contains some architectural curiosities." Restoration seldom adds to the interest of these old English churches, and Potton church has been "restored." Among the first inscriptions that caught our eyes was that to Mr. Whittingham, the vicar who was "one of the principal persons in Potton besides papa."

Some three miles through Everton brought us to the beloved Woodbury—an old mansion, among woods and gardens, on the margin of the "famous Gamblingay heath," commanding extensive views north and west. It has been remodelled and enlarged, but around is unchanged—the woods and heaths in which Emily used to wander, the old trees, the furze bushes under which she related stories to her brothers and sisters, "Foxhill Wood," and "White Wood," which she so often refers to. We in some measure realized her enthusiasm for the district. The quiet was broken only by the songs of birds. In no part of England are the nightingales more numerous. Every sense was charmed. Everton Church, which the family used to attend, is an interesting twelfth-century erection, with a later tower and perpendicular insertions. It is in itself worth the journey from London. We met none who could remember the family, or who had seen or heard of the Journal. Fortunately we had the volume with us, and by the help of a friendly resident and the vicar, who took us in to tea in his ideal English vicarage, we learned all that was possible within a short period to connect the present of the district with the past. We felt drawn very near to Emily and to the times of which she wrote.

One old man in Potton was suggested as likely to remember something. I traced him up late in the evening to the bar parlor of the "White Swan." There I found him one of a company given over to "churchwardens" and jugs of ale, discussing the news of the day, as probably in the same parlor the news of the Battle of the Boyne and the surrender at Yorktown were discussed. He remembered Mr. Shore occupying Brook House and Woodbury, and called to mind the pranks of some of the young noblemen he taught. But of Emily there was no trace of recollection. I have spoken of the order and civilization apparent all around, but the wide stretches of high cultivation without houses, the manner in which the people have been swept off and dissociated from the land, is painfully striking. When Ireland gets a little more chance—Ireland, where the people, or a large proportion of them, have all through held on to the soil with such desperate tenacity and through such bitter suffering—I think there will be a more natural and healthy state, at least so far as agriculture is concerned, than here in England. The circle in the Swan was on the whole radical and liberal. The discouragement thrown in the way of laborers' saving by the impossibility of their procuring small holdings, was spoken of, and I thought I never heard a more bitter comment on the present condition of affairs regarding land in England than the exclamation of one of the company: "A poor man obtain land here! Why, you might as well ask Sir —— [the principal proprietor in the district] to sell you some of the teeth out of his head. And what is more, if he were willing, he could not, it is so tied up." Surely this land of England—this land that has given birth to so many Emily Shores, where freedom has "broadened down from precedent to precedent"—will not much longer rest content under the trammels regarding the sale and division of land which at present bind down and hamper its people. So, in the parlor of the White Swan at Potton, our conversation quickly turned from a vain search after recollections of the past to discussions on things of the present. So even the Journal of this reserved maiden, with its spirit of sweet repose, the brief record of a life that closed more than half a century ago, has led us back to the burning problems of to-day; and so do Potton and Woodbury know her no more whose short life here has to some almost consecrated the district. Her journal will insure her a longer life on earth and a wider circle than she herself knew.

D. B.

THE SALON IN THE CHAMP DE MARS.

PARIS, May, 1891.

IN writing a notice of some seventeen hundred pictures, almost inevitably a few of the most important are accidentally overlooked. In my paper on the Champs-Élysées Salon, I find that I omitted all mention of MacEwen's "Chez le Bourgmestre," which is not only one of the best things he has yet shown, but, in point of artistic merit, among the most interesting contributions to the exhibition. It is a very small canvas, and the scene is the Dutch interior in which he has so often worked. It might be suggested that equally artistic results could have been obtained had he taken for subject the people and costumes of our time, as in his well-known picture of little Dutch boys, instead of those of a bygone age. It must also be admitted that there is a tendency in MacEwen's work, as in that of Melchers and other men of the same school, to repeat the same effects, the same methods, the same problems, until there is danger that these may be reduced to a mere formula, and their painting become as much of a convention as that of the older generation against whose academic formality it was in the beginning an expression of revolt. "Chez le Bourgmestre," for example, is lighted from the top, as is almost every picture MacEwen is now giving us, as are so many canvases in every modern French show, so that to-day there is as little individuality in this particular arrangement of light as in the frigid classicism of Bouguereau or the learned draughtsmanship of Laurens and Bonnat.

That the cry at present, whether from Impressionist or *Décadent*, is all for individuality is not the mere *fin de siècle* affectation it may seem; for individuality is but the new name for style, and without style no man's work, in art or literature, can have the least value. If with artist, as with author, "to know when one's self is interested is the first condition of interesting other people," the second is to express this interest in a manner which will at once stamp one's creations with a character of their own. To succeed in this is to write, or to paint, with style, with individuality. It is because neither condition is fulfilled in the great mass of the paintings at the Champs-Élysées that that exhibition is so tedious and dull; the fact that their necessity is at least realized gives zest and life to the collection in the Champ de Mars.

The genuine individuality there, however, is not as great as it at first appears to be. The striking activity displayed upon the walls, in the contrast it presents to the passive acceptation of established conventions in the old Salon, may be mistaken for originality; but it is really the result of the astonishing influence two or three unquestionably original men have had upon the present generation of painters, and even upon a number of the older men who had already developed methods of their own. A few leaders, like Whistler, Manet, Degas, and, above all, at the present moment, Claude Monet, have revolutionized the art of painting in our day, and the Champ de Mars Salon is the most eloquent tribute to their power. To appreciate the wide difference between active imitation and true individuality, one has but to turn from the many sham Whistlers to the master himself, who, with his usual love for a jest, exposes the false pretences of the much-vaunted modernity in painting by sending a portrait and a marine done twenty and thirty years ago, both masterpieces in their way, and both full of those qualities prized as the most modern attributes of art. They have been seen before, I think, and are too well known to be described in detail. One is the portrait of Miss Corder, or an arrangement in black; the other, a harmony in green and opal at Valparaiso. Whistler has never triumphed so completely.

But the influence of Monet is the most widespread. He, who has never exhibited, who does not exhibit now in the large shows, is here supreme. The open-air problems which he first sought to solve have become common property; the technical methods which he first employed assert themselves on every other canvas. Indeed, the two chief characteristics of this exhibition are the prevalence of *plein-air* experiments and the increasing tendency manifested to get one's effects by means of spots or points of color which fall into harmony when seen from the proper distance. It is curious, too, to note how the late popularity of pastels has in many cases exaggerated this tendency, painters seeking to produce in oils the effects peculiar to pastel. The results are anything but happy; Monet's method knows no half way between success and failure, while the painter who borrows his technique from the pastellist becomes either niggling, or else liny like Raffaelli, in whose work undoubted cleverness is marred by no less undoubted affectation.

Of course it is among the landscapes that the new treatment of light and atmosphere, introduced by Monet, is most conspicuous. Cazin, whose eight pictures this year hardly would have gained him his great reputation, and Billotte, who sees in nature but grayness and soft mist, and Damoye, who already seems strangely old-fashioned, have not fallen under the spell. But their low-toned landscapes are overshadowed by the far more numerous studies of hot sunlight and brilliant outdoor effects. The disciples of Monet, in their degree of indebtedness to him, vary from slavish imitation to original interpretation. At one extreme is Sisley, who at the best is but a copyist; at the other, Edelfeldt, who, working out Monet's theories to suit his own artistic temperament, has evolved a very distinct and fine style of his own. His landscapes are the most wholly satisfactory of all exhibited this year. Refined in color and technique, strong in sunlight, bathed with air, they are absolutely true to nature in their record of outdoor impressions, absolutely true to art in the manner in which this record is made. Those who always look for the subject in a picture may be struck principally with the fact that his largest canvas represents, on a hillside overlooking a Norwegian fiord, Christ with a Magdalen in modern Norwegian dress at his feet. Those who care for beauty artistically expressed are concerned solely with the masterly way in which the two figures are given in their real relations to the landscape. Indeed, so little does the interest of his work depend upon human subjects, that the two smaller canvases, in which it is of the homeliest and most ordinary kind, are far more successful because of their artistic achievement.

Montenard, who has been painting in Provence, where, in rendering the sunlight that floods its olive orchards, its wide waters, its old amphitheatres, he has been less sensitive to the beauty of its color; Dumoulin, who has gone to Rome for his sunshine and to Paris at night for brilliancy of effect; Dauphin, Le Camus, Dinet, are other of the prominent men most obviously inspired by Monet. But perhaps no experimental working-out of his theories is as interesting as the two very large panels painted by Chabas to decorate the walls of the mairie at Montrouge. Here we have out-door effects treated on a large scale for the purpose of mural decoration. A wedding party, suggesting the famous scene in 'Jack,' and a picnic have been made the excuse for the study of a crowd in the open air. Seen too near, the atmosphere fairly sticks out of the frame, the violent purples and blues are disagreeably aggressive; at the proper distance, the atmospheric relations are just right, and the color scheme resolves itself into a pleasant harmony. The important question, which I hope Chabas has considered, is whether in the mairie one ever will be able to get to this proper distance; at the Champ de Mars you must go almost to the far side of the great stairway (the pictures hang in the balcony) to see the work as it should be seen.

It is curious to contrast this realistic, or one might say naturalistic, treatment with the conventional decorative methods of Puvis de Chavannes, who also shows a panel for the Paris Hôtel de Ville and two for the Museum in Rouen. Chabas has not yet Puvis's thorough command of his resources; he has plainly not passed beyond the experimental stage. But he at least proves that his scheme perfected will give greater scope for beauty of color and decorative feeling, and holds out the hope that from a new school of decoration may come some of the finest work the world has yet seen. However, Puvis de Chavannes has seldom shown to better advantage than in his large "Summer" for the Hôtel de Ville, where the great beauty of the landscape makes up for the figures, ugly in color and ungraceful in pose, in the foreground. There is a strange suggestion of Burne-Jones in the other panels; that is, in the drawing of the figures, but not in the color, which, as usual with this artist, is as pale and subdued as it is bright and almost crude with the English painter, nor in the handling, which is bold where Burne-Jones is niggling, nor in the whole effect, which can be appreciated at a reasonably remote distance which would reduce Burne-Jones to mere patchwork.

If in the landscapes the endeavor is to reproduce Nature herself, in the portraits the effort is to show real men and women in their natural environment, and not mere puppets set up against the invariable curtain or blank wall. There are men who, like Roll and Besnard, consider every portrait they paint a new problem of light and air, and who continually startle by the daring of their realism; there are those who, like Sargent (this year in his Mrs. St. Gaudens and her son, already seen in New York) and Boldini, are less concerned with atmospheric conditions, though these they do not ignore, than with strongly marked human characteristics; and again, there is an entirely original man, like Carrière, who sees everybody and everything according to a convention of his own, and yet in reproducing them on canvas shows them with striking force and actuality. He has in the present exhibition portraits of Alphonse Daudet and Paul Verlaine which are veritable masterpieces in their rendering of character. But when his mannerisms are copied, as they are by two or three of his imitators who also exhibit, then they degenerate into weaknesses, for his neutral color and all-pervading mist may be imitated, but not his individuality.

Though, at first, it is in the portraits that the greatest activity seems to be manifested, that one is most conscious of experiment, that the painter apparently has found freest scope, it does not take long to discover that here, as in the landscapes, there are two or three artists who lead, many who, with more or less cleverness, follow. Like Carrière, Besnard and Boldini have their students. Bes-

nard fortunate in being studied by a man of the ability and talent of Point, but Boldini less happy in being taken as master by men who can only exaggerate his eccentricities, reducing them to mere tricks, and who could no more paint flesh as he does, for example in the plump arm of a stout lady in evening dress (whose portrait, in its uncompromising truth, reaches the high-water mark of his accomplishment), than they could originate his skilfully managed color schemes. More independent in their methods are Picard, who is marvellously clever and effective; Friant, who has a capital little portrait of Coquelin and his son, and another of a man and woman with their well-studied shadows thrown on the wall behind them; and Blanche, who, one feels, would do better if he did not do so much, for his portrait of his mother is as careful and as full of character as many of his other canvases are characterless and suggestive of over-haste. Two men, to whom one naturally turns for good work, each after his own fashion, Duez and Gervex, are disappointing. But even where one finds but failure, even where imitation is but ill concealed, there is a healthier tendency than in the copies of conventional models and the failures to work up to a conventional standard that cover the walls of the old Salon, or the middle-class mediocrities that adorn the Royal Academy. It seems as if it was to emphasize the healthiness of the new movement that Carolus-Duran has sent his work to the Champ de Mars Salon; for distinguished as are his portraits, especially those of Gounod and Billotte, they seem out of place and out of date, conventional and lifeless, compared to the canvases which surround them, while the strikingly weak portraits by Frappa and Miss Lee-Robbins are there to show to what depths of commonplace the conventional methods of a strong master may lead his faithful pupils.

Still more out of place in an exhibition so entirely artistic in its interest, and coming from a man so truly an artist, is Jean Béraud's "Christ in the House of Simon the Pharisee," which appeals only to claptrap sensationalism. The guests are all represented in frock coats and trousers, Magdalen in modern evening dress; but at the head of the table, set out with coffee-cups and littered with cigarette ashes, is the traditional Christ in draperies and halo. And the figures here are not subordinate to the artistic aims of the picture—to a study of light and air, as in Edelfeldt's "Magdalen"; it is the incongruity in costume, the suggested blasphemy, that attracts the crowd and has made this picture the pictorial excitement of the year in France, just as Luke Fildes's "Doctor," with its cheap sentiment, has achieved the same distinction in sentimental England. It is not easy to say whether Béraud has approached this work in the spirit of the old masters, whose religious themes did not necessitate archæological learning, or whether he produced it as a huge *fin de siècle* joke, useful to attract attention to his delightfully clever and artistic little "Café-Concert" and other paintings which hang around it.

It is difficult to write of the Champ de Mars Salon without degenerating into a mere catalogue of names, so many are the exhibitors whose work, for one reason or another, calls for special mention and cannot be classified with that of any school or movement in art. Dagnan-Bouveret stands quite alone, and his "Conscrits," though less stimulating than the canvases of a Boldini or a Besnard, is characterized not solely by the fine drawing and sound technique which have made his reputation, but by its excellent and sincere rendering of types. It is interesting to find that the one Englishman represented is Henry Moore, whose beautiful sunlit seas lose nothing by being seen in Paris. Among the Americans are Alexander Harrison, whose landscapes and marines are good but not extraordinary; Dannat, who suffers from being hung too close to Whistler, and from an unsuccessful effort to give certain strong color effects—strength with him approaching perilously near to violence; Melchers, and Miss Trotter. The only Germans of note are Uhde, with one simple, good study of a girl, and Liebermann, who, in his rich and quiet sunlit landscape, has more in common with the school of Barbizon than with the *plein-airistes*. The Norwegians are in greater numbers: to the most distinguished, Edelfeldt, I have already referred. Both Louis Deschamps and Lhermitte fall below their usual high average. Alfred Stevens is as prolific as of yore, and in some charming little sea studies shows that he, too, owes something to Monet. I must not overlook Gilbert's good realistic paintings of a railway station, destined, with so much of the good work of the year, to decorate the Hôtel de Ville. Ribot never was so powerful as in some wash drawings, which have all the richness and old-masterish feeling of his large oil paintings without their affectation.

For the first time in a yearly exhibition Vierge exhibits the remarkably brilliant originals of the engravings which constantly appear in *Le Monde Illustré*. While Le Fère is fairly startling in the knowledge and ability he evinces in many mediums, in oils and water-colors, etchings and woodcuts, he succeeds equally well in giving expression to a strong individuality. Boldini and Carrier-Belleuse are again to the fore in pastel. And Rodin, who sends but one vigorous bust of Puvis de Chavannes, continues the most modern among sculptors; his influence, moreover, manifesting itself in much of the work, more particularly in some striking designs for a tomb by Bartholomé. Dampf's busts and Ringel's medallions in low relief are also prominent in the small and not too interesting collection of sculpture.

A small frame, draped in black and hung in the centre of one of the large rooms, really is the most significant feature of the show. It is a little water-color sketch, dated 1848, by Meissonier, much freer in treatment than the finished paintings he was used to exhibit. It is not his work, however, but rather his death, of which the crape is a reminder, that is so full of significance in the Salon in the Champ de Mars. Puvis de Chavannes, who has succeeded him as President, is stronger as a painter, but not as a leader of men. And rumor has it that already trouble is brewing in the Society over which he presides, that he will not be able long to hold it together, and that in two or three years' time many of its most accomplished members will return to the Champs-Élysées, where they will be received with open arms. How true this is, time alone can show.

N. N.

GENERAL MARBOT.—II.

PARIS, June 10, 1891.

I LEFT Marbot on the staff of Augereau in 1804. In the month of February he joined him in a journey to Paris, where Augereau had to have a conference with the First Consul on some project of a French landing in Ireland. They arrived at the time when the conspiracy of Pichegru, Moreau, and Cadoudal was discovered. Marbot says but little of the execution of the Duc d'Enghien, which was one of the consequences of this conspiracy.

"This execution was generally blamed. One might understand that if the Prince had been taken on French territory, the law should be applied to him, and in that case the law was capital punishment; but to go and seize him across the frontiers, in a foreign land, seemed a violation of the law of nations. It seemed, however, that the First Consul had no intention of executing the Prince, and only wished to frighten the royalist party which conspired his own death; but Gen. Savary, the chief of the gendarmerie, having gone to Vincennes, seized the Prince after judgment had been pronounced, and, by an excess of zeal, had him shot, in order, he said, to spare the First Consul the pain of ordering the execution of the Duc d'Enghien, or the danger of leaving alive such a dangerous enemy. Savary has since denied having said these words, but those who heard him have assured me that he did. It is certain that Bonaparte blamed Savary's haste; but, the fact once accomplished, he had to accept the consequences."

Marbot felt like the great majority of the French people; he forgot the execution of the Duc d'Enghien, and was delighted when Bonaparte was made Emperor by Senatorial decree of May 18, 1804. On this occasion, eighteen generals were made Marshals of France; the French army became, in a sense, Napoleon's army. The Legion of Honor was instituted, and this creation of a new order gave Napoleon the means of satisfying the bravest officers who had fought the campaigns of the Republic. Marbot tells the story of a soldier who had been in the Egyptian campaign, and had become a servant of M. de Narbonne. When M. de Narbonne heard that his servant had been decorated with the new order, he said to him, at the moment of sitting down at table: "It is not proper for a Knight of the Legion of Honor to hand plates, still less so to leave off his decoration to do my service; sit down by me; we are going to dine together, and to-morrow you shall go to my country place and be my gamekeeper, which is not incompatible with wearing your decoration." M. de Narbonne was an *émigré* who had been allowed to come back, and who afterwards entered the service of Napoleon.

At the camp of Boulogne Marbot was made a lieutenant, at the request of Marshal Augereau. Napoleon did not invade England, but turned his army towards the Rhine. Of this army Marbot says that life in camp had produced an excellent effect on it: "Never did France have a better instructed army, better composed, more anxious for battle and glory; and no general ever united so much power, so many material and moral forces, or used them more cleverly. Napoleon accepted war with joy, so certain was he of conquering his enemies and using their defeat for the solidification of his throne, as he knew the enthusiasm which glory has at all times excited in the chivalrous spirit of France." Marbot enters into many details on the campaign of 1805. He had himself important missions to fulfil as aide-de-camp.

"This year," he says, "opened for me a succession of combats which lasted ten consecutive years, since it only ended at Waterloo. However numerous were the wars of the Empire, nearly all French military men enjoyed one or several years of rest, . . . but, as you will see, it was not so with me, as I was always sent from north to south, from south to north, wherever there was fighting, so that I did not spend one of these ten years without being under fire and without losing blood in some one of the countries of Europe."

In the campaign of 1805 Augereau forced Jellachich to capitulate at Bregenz, and then continued his march towards the Danube. Marbot was chosen, with another officer, to carry the flags of Jellachich's corps to the

Emperor, whom he joined at Brünn ten days before the battle of Austerlitz. He had, on this occasion, to play a part in a curious little comedy. Prussia was not yet at war with Napoleon, but there was a powerful party at Vienna which desired that Prussia should immediately unite her arms with those of Austria and Russia. The King, who hesitated, sent his Minister, Haugwitz, to the French headquarters. It has been said, with some truth, that ambassadors are privileged spies. The King of Prussia sent Haugwitz to Napoleon, apparently with the simple mission of bringing him a letter in answer to one which Napoleon had sent to him, and in which he complained of the treaty that had been made at Potsdam between Prussia and Russia; but in reality in order to inform himself exactly of the situation of the belligerents. Haugwitz arrived a few days before the battle of Austerlitz, and Napoleon wanted to make a strong impression on his mind. The flags of Jellachich's corps had already been presented to the Emperor, but Napoleon wished the ceremony to be repeated. He was talking with Haugwitz when the sound of martial music was heard.

"The Emperor, hearing this music in the palace court, feigned astonishment, went to the window, followed by the ambassador, and, seeing the trophies carried by non-commissioned officers, he called for the aide-de-camp on duty, and asked him what was the matter. The aide having answered that the two aides of Marshal Augereau had arrived, bringing to the Emperor the flags of the Austrian Corps of Jellachich, taken at Bregenz, we entered, and then, as if he had not seen us, Napoleon received Marshal Augereau's letter, which had been resealed, and read it, though he had known its contents for four days. Then he asked us questions and entered into the most minute details. Duroc had told us that it was necessary to speak loud, as the Prussian ambassador was a little deaf."

Marbot spoke, presented the flags, named the regiments. He made a great impression when he showed the flag of the infantry regiment of the Emperor of Austria, and the flag of the Uhlans of his brother, the Archduke Charles. "You see, sir," said Napoleon to Haugwitz, "my armies are triumphant everywhere; . . . the Austrian Army is annihilated, and it will soon be the same with the Russian Army." The comedy played, Napoleon told Haugwitz that the position was not very safe for a diplomat, and advised him to go to Vienna, where he would see Talleyrand. Haugwitz left the same evening. This curious episode shows a side of Napoleon's character which is not without interest—that side which the Pope at Savona is said to have clearly noticed, when to all the speeches of Napoleon he answered merely first, as if speaking to himself, "Comediante—tragediante."

The account of the battle of Austerlitz is extremely interesting, but we will note only an incident which concerns Marbot personally. It is well known that the French artillery fired on the ice of some ponds which were thronged by the Russians, and that many Russians were thus drowned upon the breaking of the ice. After the battle was over, Napoleon saw a poor Russian non-commissioned officer on a piece of ice on the point of being drowned. Marbot, under the eyes of the Emperor, took off his uniform, threw himself into the water, and with great difficulty saved the Russian at the risk of his own life. Marbot is very candid; he says: "I will not make myself out better than I am; I must confess that, having witnessed a battle where I had seen thousands of dead and wounded, my sensibility was blunted, and I was not philanthropic enough to run the risk of congestion of the lungs in disputing with the ice the life of an enemy"; but the Emperor was looking on, and had said to the soldiers around him, "Try and save this man," and he tried.

The battle of Austerlitz was followed by an interview between the Emperors of France and of Austria, "a spectacle well calculated to inspire philosophical reflections. An Emperor of Germany coming humbly to solicit peace from a little Corsican gentleman, an ex-officer of artillery, whom his talents, fortunate circumstances, and the courage of the French armies had made the arbiter of the destiny of Europe." After Austerlitz came Jena. Before this new campaign, Marbot spent some time in Darmstadt. He had two missions to fulfil, and carried despatches from Germany to Paris, from Paris to Berlin. Marbot explains the defeat of the Prussian Army by its composition and organization. All the captains were, so to speak, proprietors of their companies; they enrolled all the vagrants of Germany. The soldiers were ill-fed, ill-clothed, and subjected to an iron discipline; they had no patriotism; the officers were poor gentlemen, and promotion was given only by seniority; the generals were too old, and not able to bear the fatigue of a campaign. The memory of the great Frederic gave to the Prussian Army a sort of prestige; but it had no chance, as the event proved, against the conquerors of Italy, of Egypt, of Germany, and of Austerlitz.

The victory at Jena had immense results. To the conquests made in Prussia, Napoleon added the States of the Elector of Hesse-Cassel. The Elector had a great treasury, and was one of the wealthiest capitalists in Europe. He took refuge in England, and confided fifteen millions of francs to a Frankfort Jew named Rothschild. This is the origin of the wealth of the famous house of that name. In vain did an Imperial Commission threaten Rothschild, examine his books, offer him half the sum if he would give up the other half. The deposit remained safe in his hands till 1814.

After Jena, Napoleon entered Poland. He had hoped to reconstitute the ancient kingdom, but the Poles did not stir. Kosciuszko, who was living quietly in Switzerland, refused to come and join the French. Napoleon crossed the Vistula and fought the battle of Eylau. In this terrible battle Marbot had to carry an order to a French regiment standing by itself on a small eminence. This regiment, the Fourteenth, was surrounded by Cossacks, and it was almost certain death to carry the order. Marbot had an excellent horse, which he had bought for a trifle because it had the dangerous habit of biting. Trusting to Lisette, he spurred her, and let her go; lighter than the wind she flew over the battle-field, and nothing could stop her. Marbot arrived at the square formed by the Fourteenth of the line, and delivered to the colonel the order to leave his position and join the corps. The officer in command told him that he saw no means of saving the regiment; he gave him the eagle of the regiment, and bade him carry it to the Emperor. These eagles, which were fixed at the end of the flag, were very heavy; at the moment when Marbot was breaking the staff, so as to keep only the eagle, the Russians advanced and made a charge. Marbot saw the grenadiers coming; at that very instant a bullet struck his hat, and came so near his head that the concussion paralyzed him; he still saw, but could not move. He was on Lisette, a grenadier was upon him and he could not defend himself. Lisette jumped at the Russian and bit him fearfully in the face; Marbot then became insensible. He only came to his senses in the night, when he found himself naked, and a man, with one foot on him, trying to take off one of his boots. His movements scared this man, who had thought him dead. Soon afterwards, his valet, who was looking for him on the battle-field, found him. He was saved; Lisette also was saved. They were both well taken care of. Marbot was sent to the hospital—his foot had been frozen during the night which followed Eylau—but he soon recovered, and was able to rejoin the army in time to assist at the battle of Friedland. And here ends this extraordinary book, which will be read with as much interest as the most sensational novel.

Correspondence.

MR. BANDELIER AND THE SOUTHWESTERN LAND COURT.

To the Editor of The Nation:

Sir: Mr. Bandelier, whose article in your issue of May 28 last has attracted a good deal of attention in the West, enjoys so excellent a reputation as an archæologist and enthnologist that, were he to write upon subjects with which his studies have made him familiar, it would require considerable assurance in one not thoroughly informed upon them to question the correctness of his views. But when he attempts to instruct the public in general and the Supreme Court of the United States in particular upon matters of law, even one unlearned in the intricacies of Tehua and Nahuatl may possibly be pardoned for concluding that Mr. Bandelier is not so erudite in legal matters as he would like to make us believe by his ingenious references to the obscure ordinances and royal decrees of past centuries, which have little or nothing to do with the question of the settlement of land titles in the Southwest.

The question is one of law and not of sentiment; one requiring a knowledge of legal methods rather than familiarity with the topography of the country in which the claims to be adjudicated are situated, or an acquaintance with the customs of the people. The courts of the United States have upon many occasions decided questions requiring quite as much erudition as any that will be presented to the new Land Court. Hundreds of private land claims, having their origin under other governments than ours, have been presented to the tribunals established for their adjudication, and no difficulty has been encountered in finding persons perfectly competent to fulfil the duties usually required of judges. Why such persons may not be found now for the Southwestern Land Court one may well be at a loss to understand.

The provision of the act that appears to have excited Mr. Bandelier's powers of ridicule in the highest degree is that excluding citizens of the Territories from becoming members of the court. This, he says, "secures absolute theoretic impartiality." Why does he hesitate to tell the truth? The provision in question secures also practical impartiality. Mr. Bandelier has lived in the Southwest for years, and knows, or certainly ought to know, that there are very few if any attorneys in that region whose legal acquirements fit them for the position of judges who are not so bound by political, social, and personal ties to many of the claimants of these land grants as to make their appointment as members of the court extremely improper. Judges are needed who have no political ambitions in regard to positions of honor within the gift of the Territories, who have had no

business relations with their prominent attorneys and wealthy citizens, and who have no interest in perpetuating in power and in the enjoyment of immense tracts of the public domain the dynasty of old and wealthy families which has so long ruled the Spanish-speaking portion of the Southwest. The necessity of the appointment of such men was foreseen by the gentlemen who framed the Land Court Bill, and was wisely provided for.

Mr. Bandelier informs us that some of the titles conveyed absolute dominion, others were usufructs only, while others included both. This is very remarkable indeed, but may we not be justified in believing that the judges will be quite as competent to decide as to the nature of the titles presented to them as is the learned gentleman who appears to be so alarmed at the probability of the appointment of impartial and competent men? There is no good reason for believing that injustice will be done claimants who have good titles, although Mr. Bandelier appears to anticipate that such will be the case. An examination of the cases filed with the Surveyors-General of New Mexico, Arizona, and Colorado, under the act of 1854, will convince the most sceptical that the attitude of the Government officials towards grant claimants has been more than generous. The confirmation of many claims by Congress has been even hasty, and sometimes absolutely careless, resulting in the loss to the Government of many thousands of acres of valuable land to which claimants had little or no right. Take, for example, the notorious Maxwell grant, confirmed and patented for nearly two millions of acres; the Ortiz Mine grant, patented for over sixty-nine thousand acres of valuable mineral land, without the slightest proof that an absolute title had ever vested in the original grantees to the extent of a single foot of the land now held under the patent of the United States. These two cases are no more outrageous in their nature than numbers of others that might be mentioned, notwithstanding that in the case of the Maxwell grant the area patented by the United States is equivalent to about four hundred square leagues, while the original grantees stated in reply to an inquiry by the Mexican officials that the land for which they petitioned did not exceed fifteen or eighteen leagues.

Still, in the face of these facts, Mr. Bandelier appears to be extremely apprehensive that great injustice may be suffered by grant claimants at the hands of the inexperienced judges who are to be appointed from the effete East. He seems to ignore the fact that the United States has some interest in the matter, and has a right to protect that interest by such legislation as it may deem proper. There is no other way in which the lands belonging to the public domain may be known than by clearly defining the limits of those private land claims which, under its treaty obligations, the Government is bound to respect; but let it not be forgotten that those obligations are not of such a character as to prevent the Government from prescribing the mode of deciding the validity or invalidity of these claims, or of limiting the period within which they must be presented to the proper tribunals in order to obtain recognition. Even a title that was perfect at the time of the change of sovereignty may be declared to be without validity if the claimants fail to observe the formalities prescribed by the Government for its adjudication.

P. T.

Denver, Col., June 8, 1891.

THE PUNISHMENT OF DRUNKENNESS.

To the Editor of The Nation:

Sir: The act relating to the punishment of drunkenness recently passed by the Massachusetts Legislature deals with a subject of such importance, and is such a wide departure from the existing methods of dealing with it, that an abstract of its provisions may be of interest to your readers.

Arrests for drunkenness generally outnumber those made for all other offences. In Massachusetts, in 1890, they constituted over 65 per cent. of all arrests. Our law is peculiar in making simple drunkenness in a public place an offence for which an arrest can be made without a warrant. Elsewhere, some degree of disorder must accompany public intoxication before the arrest can be made. But our law is right in this: for the sake of public decency, and for the protection of the intoxicated man himself, the power to shut him up until he is sober should exist. How best to deal with him after he becomes sober, so as to protect the public interests, and yet to punish or to help him, is the difficult problem. Imposing a petty fine as the penalty for drunkenness does not solve this problem, and yet it is the solution heretofore accepted here, and generally accepted elsewhere. A fine does not deter. Men don't count the money cost of a spree. If the offender has the money, the fine is no punishment; if he hasn't it—which is the usual case—a distracted wife or mother must pay, which punishes the innocent who are already suffering enough. Again, the fine to be effective must be enforced by the penalty of imprisonment. This imprisonment is not for drunkenness, nor is it graduated with reference to the man's previous record for good or bad behavior, but is a uniform imprisonment of thirty days for not having five dollars, imposed on the poor man who may least deserve the disgrace and loss which it entails, while the well-to-do offender goes free.

There are distinctions in our law between first and frequent offenders, and larger fines and terms of imprisonment may be imposed if previous offences are alleged in the complaint and proved. But, in practice, complaints are made by arresting officers, who either know nothing of the man's previous record, or, knowing it, have neither the time, inclination, nor evidence to prove it. In Massachusetts last year, 23,575 out of the 25,582 persons arrested for drunkenness and committed, were imprisoned for non-payment of fines. We find, in consequence, hundreds of men each year returning tens and scores of times to our prisons for non-payment of fines, and we find further, what is worse, many committed by this wholesale system who really are first offenders, and never should be imprisoned, whose future is marred and often ruined by the loss of place and character and by the criminal contamination which imprisonment has brought upon them.

To do away with the fine system, and to substitute a method which should deal with persons arrested for drunkenness as individuals, and not in the mass, and which should give the courts the help needed for this just discrimination, has been the aim of the Massachusetts Prison Association in preparing and urging the passage of the bill which has just become a law.

This law does away with the distinction between "first," "second," and "third" offences. Every conviction for drunkenness may be punished by imprisonment, within the discretion of the court, of from one day to one year in jail, or to an indeterminate sentence, not exceeding two years, in the reformatory. To enable the courts to exercise this discretion intelligently, the bill imposes upon probation officers the duty of investigating and reporting to the court the record of each offender, and provides for a system of records in the courts and a compulsory interchange of information between the probation officers and the police and the officers of correctional institutions, which will greatly facilitate the investigation.

By a bill also passed this session, the appointment of probation officers by the judges in every criminal court of the Commonwealth is made mandatory. These officers, chosen by the judges, and having their confidence, will form a corps of intelligent assistants, who, with a few months' experience, will be of invaluable service in providing the courts with the evidence necessary for a discriminating and just disposition of these offenders.

The new law will assist and relieve the courts in another way. A large number of those arrested for drunkenness are not frequent offenders or habitual drunkards. Under some special temptation or stress of circumstances, they take too much. This may happen a few times in the course of a lifetime, or once or twice a year, while at other times they are sober, industrious men, the bread-winners of their families. To such men imprisonment is a disgrace, a loss of place, a possible discouragement leading to confirmed drunkenness. For them to be immediately returned to their work is the best thing possible. To take up the time of the courts with their trial, to incur the expense of their committal and their board and lodging for thirty days in order to collect a fine of $5, or its equivalent, and then not to get it, is for the State worse than foolish. To meet such cases the bill provides that any person arrested for drunkenness may request to sign a statement, giving his name and address, and alleging that he has not been arrested for drunkenness twice before within the twelve months next preceding. If the officer in charge of the place of custody, not the arresting officer, endorses on this statement that he is satisfied that it is probably true, he *may* release the arrested person, pending an investigation of the truth of the statement by the probation officer. If that investigation shows the statement to be true, nothing further is done; if untrue, it becomes the duty of the arresting officer to take the man again into custody and complain of him for drunkenness.

The power of release, always a dangerous power in the hands of the police, is here guarded by giving it only to the commanding officer of the station, by requiring his signature to the probable truth of the statement, and by making it a conditional release only. And yet the thing desired—the prompt release of persons who should not be forced into the dock with old offenders and further disgraced by trial and commitment—is obtained. If the arrested man is not released, he is complained of and tried. After conviction his case may be placed on file or probation if the court finds him deserving of this further chance.

Under this new law, while it will be easier to save from the disgrace of trial and imprisonment the occasional offender who should not be branded as a criminal, it will also be easier to find out and adequately punish the "rounders," and those who, though seldom arrested, are, through drink, a terror to their families. Longer terms of imprisonment for them will protect the public if they are incorrigible, or will give them a chance for reform if reform is possible.

This law is believed to be thoroughly practi-

cal. It was drafted after most careful deliberation and consultation with many of our judges, officers of penal institutions, commissioners of police and public institutions, and persons who, in the various philanthropic and charitable institutions of Boston and elsewhere, have come much in contact with the evils of the present system. These evils exist elsewhere. We hope that the success of our experiment will lead to similar legislation in other States. J. G. THORP, JR.

CAMBRIDGE, MASS., June 13, 1891.

Notes.

D. C. HEATH & Co. have in press an 'Introduction to Modern French Lyrics,' by Prof. B. L. Bowen of Ohio State University.

Mrs. Sara E. H. Lockwood has revised for younger pupils Prof. Whitney's 'Essentials of English Grammar,' which Ginn & Co. will publish during the present season.

Worthington & Co. announce 'Columbia,' a story of the discovery of America, and first of a series of American historical novels, by John R. Musick.

A collection of short stories by George A. Hibbard will presently be brought out by Harper & Bros. under the title, 'Iduna, and Other Stories.'

The new London publishing house of James R. Osgood, McIlvaine & Co. is apparently going to make a specialty of introducing American short-story writers to the British public. It has published already Miss Wilkins's 'New England Nun,' Miss Jewett's 'Strangers and Wayfarers,' Mr. Eugene Field's 'Little Book of Profitable Tales,' Mr. R. H. Davis's 'Gallegher,' and Mr. Joel Chandler Harris's 'Balaam and his Master,' and it has in preparation collected stories by Mr. Thomas A. Janvier, Miss M. L. Pool, and others.

The Clarendon Press, Oxford, will shortly publish a new edition of the late Sir George Cornewall Lewis's 'Government of Dependencies,' which will be edited by Mr. C. P. Lucas, B.A., of Balliol College, Oxford, and of the Colonial Office, London. Mr. Lucas is the author of the three volumes as yet published of the 'Historical Geography of the British Colonies,' which also is being issued from the Clarendon Press. For this admirable series the author is now preparing a volume upon the North American portion of the British Empire, while his colleague, Mr. Antrobus, of the Colonial Office, is at work upon the West and South African Colonies, to be treated of in one volume. The Australasian Colonies will form the subject of a subsequent book.

In his contributions to the 'History of the Southwestern Portion of the United States' (Cambridge: John Wilson & Son), Mr. A. F. Bandelier gives us the first of what he hopes may be a series of monographs on a subject which he has so extensively studied—the early Spanish explorations and the native civilization of their time. In the present volume, published at the joint expense of the Archæological Institute of America and of Mrs. Mary Hemenway, the principal papers are on the wanderings of Cabeza de Vaca and the expedition of Fray Marcos of Nizza. On all sides appears the extent of the author's resources, not the least notable among them being the light he is able to throw upon ancient obscurities from his own personal travels and residence among the Indians. One is left with a feeling as of outrage that such a scholar cannot enjoy access to the archives of Spain, where, he feels sure, the clearing up of so many mysteries would result from his investigations.

A second edition, enlarged and revised, of the 'Handbook of the American Republics' is issued by the Bureau of the American Republics at Washington. Some of the rather pompous Pan-Americanisms of the first edition are cut out, and some valuable additions appear. The proposals for the "Columbus exhibit" at the Chicago fair have an unconscious humor which only a Harrisse or a Winsor could fully appreciate. The volume contains a great deal of information compactly arranged and well printed.

'A Ride through Asia Minor and Armenia,' by H. C. Barkley (London: J. Murray), gives an extremely vivid idea of the condition of this part of the Turkish Empire shortly after the close of the Russian war—a condition probably unchanged in its essential particulars to-day. The author's route was from Brusa to Angora, and thence to Kaisarieh through the Cilician Gates to Adana. Turning here to the northeast, he crossed the plains of Mesopotamia to the headwaters of the Euphrates and Tigris, reaching the Black Sea at Trebizond. The universal impression received was of a country rich in agricultural and mineral resources, but ruined by corrupt officials, lack of enterprise, and by the insecurity of life and property. In all parts, however, Mr. Barkley found among both the Turks and the Armenians a confident expectation of the speedy coming of the English to "govern them properly." With this change of rulers their troubles would cease and the land would again become rich and prosperous. Drunkenness among the Turks, he says, is greatly on the increase. "Few of the upper class abstain, and many make it a rule to go to bed drunk every night." The Armenians also impressed him unfavorably as a cringing, slavish race, who are satisfied with a mere veneer of civilization. Of the Tartars, on the other hand, he says they are "the most helpful and the most capable of improvement of all the races—in fact, the only one with energy, brains, and ambition." The work of American missionaries is frequently referred to in the highest terms—more, however, for the patience, courage, and devotion with which it is prosecuted than for its success.

Damrell & Upham, Boston, publish in pamphlet form an address recently given by Mr. Edward Atkinson to the Cotton Manufacturers' Association upon the subject of food and feeding as bearing upon the productive power of laborers. Mr. Atkinson has no difficulty in showing that the daily waste of food and fuel in every household, when multiplied by the number of households in the country, amounts to a very large total, and he reasons that the intelligence displayed in the feeding of cattle might profitably be applied to the scientific nourishment of human beings, and that if human beings were better nourished they would do more and better work. His figures indicate from twelve to twenty cents a day as the cost of sufficient nutriment for most people who are working or exercising. The subject deserves the attention of philanthropists.

Mr. Angelo Lewis, the "Prof. Hoffman" who has translated Robert Houdin's treatise on conjuring, and who has himself written the best books on modern magic, has now put forth a little volume about 'Baccarat, Fair and Foul, being an Explanation of the Game and a Warning against its Dangers' (George Routledge & Sons). He first explains the game, which is an easy matter, as it is of surpassing simplicity, and fitted rather for the playing of Digger Indians than of persons knowing how to read and write. Of all card games it is nearest to absolute chance, and calls for the least exercise of the intelligence. This may explain why it serves to amuse the upper circles of British "society"; but we are at a loss to understand its abiding popularity among an intelligent people like the French. Having explained the procedure of the game, Mr. Lewis sets forth at length the many possibilities of cheating, from the simple *poucette* (which Sir William Gordon-Cumming was accused of practising) to the more elaborate devices of confederacy, of marked cards, and of arranged packs. He draws on the books of Robert Houdin and of Alfred de Caston, and more particularly on the 'Filouteries du Jeu' of Cavaillé. His explanation of the methods of card-sharpers is as interesting as it is instructive.

M. Henri Bouchot follows up his 'Livres Modernes' and his 'Ex-Libris' with 'La Reliure' (Paris: E. Rouveyre). It is a well-reasoned discourse on the proprieties of bookbinding, beginning with an historical review of the modes which have prevailed during the present century. In none of these does M. Bouchot find anything but flat imitation of "tous les styles défunts," and his main object is to foster originality which shall mark the present time and restore personal inspiration to the binder himself. He does this with the aid of photographic illustrations from recent bindings which are out of the beaten path, and of which he frankly acknowledges the inequality of merit, since we are in the groping and experimental stage. His leading principle is that the design and treatment and material should be inspired by the work itself, and should have relation to the contents as the *Leit-Motiv* to the action of the operatic drama. This produces what he calls a "reliure à l'emblème," with possibilities of infinite variety. He marks the recent craze for decorating the inside of the cover, on which Grolier never bestowed a thought, and he discusses the proper stuffs for such use, as to which much false taste has been displayed. This little manual is quickly read and is certain to inculcate sound ideas.

The necrology of the alumni of Andover Theological Seminary for 1890-'91, prepared by the Rev. C. C. Carpenter, Secretary of the Alumni Association, is an astonishing record. The average age of the forty-six decedents is seventy-six years, eight months, and ten days! Two men were over ninety, nineteen were over eighty, fourteen over seventy, eight over sixty, two over fifty, and only one under that age. It is noteworthy that of the three who died under sixty, two were not college graduates, one having been a carpenter before entering the Seminary and the other having been engaged in business, while the third gave up the ministerial calling for other pursuits. The wisdom of the life insurance companies in advertising in the religious newspapers is evidently justified by the event.

The 'Century Dictionary,' so far as concerns its first volume, is the subject of somewhat minute comment in the latest issue of *Englische Studien*. Upwards of ten pages are there accorded to it, under various aspects, by the Rev. A. L. Mayhew, an Oxford philologist of high and deserved repute for extensive research and scientific thoroughness. "There is plenty of room," the critic admits, "for an English dictionary written by American scholars, and intended especially for the use of the American public. . . . And besides, when scholars in England consider how wide is the subject of English lexicography, and how it bristles with difficulties, they are ready to give a hearty welcome to any scholars, coming from any quarter, who promise to add to

our knowledge, and to help us in clearing up some of the many doubtful points which have long waited for solution." But the 'Century Dictionary' falls short, on several grounds, of commending itself to its censor's unqualified approval—as respects its adduction of authorities in exemplification of words, its comparative philology, etc.

In *Mélusine* for May–June, M. H. Gaidoz reviews with cordial approval Prof. T. F. Crane's 'The Exempla of Jacques de Vitry,' and supplies the curious information that "the tradition of the *exempla* is not yet extinct in Catholic countries," even the very name being preserved. Thus, the Société de Saint Augustin has just published 'Les Sept Douleurs de la Sainte Vierge,' in which each of the seven chapters ends with an anecdote entitled "Exemple," and one of the *exemples* begins with these words: "Hérolt relates." Hérolt was a Dominican of Bâle and a collector of *exempla* in the first half of the 15th century. M. Gaidoz cites also the 'Mois de Marie en Exemples.'

In the *Harvard Law Review* for May, Prof. J. B. Thayer has an instructive study of the older modes of trial in England, from which a tolerably clear idea may be obtained of the development of "one-sided" proof into the scientific procedure of modern times. Attention is especially directed to the institution of complaint-witnesses, as essential to the determination of the right to go to the proof—an institution often confounded with that of proof-witnesses.

The Artotype Publishing Co., No. 94 Reade Street, New York, have in preparation a monthly publication to be entitled *Dogs of the Day*, edited by H. W. Lacy. The first series will comprise twelve monthly parts, each part containing four portraits of as many breeds. Typical specimens will be selected for this curious gallery. The photographic illustrations are, of course, from life, and permanently printed in ink. Each portrait will be described. The work will be sold by subscription.

We have received the announcement of a new journal entitled *Indogermanische Forschungen*, to be published, beginning with July next, by Trübner of Strassburg, under the editorial direction of Prof. Brugmann of Leipzig and Prof. Wilhelm Streitberg of Freiburg (Switzerland). It will appear in volumes of five numbers each, without limitation of period. In the second and fifth numbers of each volume will be added a bibliographical review, or *Anzeiger*, with separate pagination. The subscription price per volume, including the *Anzeiger*, is sixteen marks. The names of the editors guarantee the importance of this new enterprise, which, though it seems to owe its existence in some measure to the personal prejudice and sectarian exclusiveness of the editors of the two existing journals in this field, proposes to avoid every appearance of partisanship and to exclude rigidly from its columns all sectarian controversy and personal polemics. For this resolution it deserves a place in our prayers.

The generous Catalogue of the Officers and Members of the Harvard Law School Association, which bears date of April 1, 1891, must inspire every member of that large body with a feeling of pride in so vigorous and rapid a growth. It embraces graduates as far back as 1825, and men of the Law School class which graduates this week, and the total is 1,615. Massachusetts and New York together furnish rather more than half, and in no other State does the membership equal 100, though Ohio, Illinois, and Pennsylvania approach that figure. The arrangement, precision, fulness, and typographical elegance of this volume leave nothing to be desired. Two views, of the old and the new home of the School, adorn it.

—We have received Nos. 2 and 3 of Volume XIII. of the *American Journal of Mathematics*. No. 2 contains an unusually large number of papers, two of the nine being in French—one by M. d'Ocagne, the other by M. Appell, both of whom are known to readers of the *Journal* by previous contributions to which the present ones are supplementary. Dr. Oskar Bolza continues his series on the "Theory of Substitution-Groups." In fact, five of the articles are more or less intimately connected with previous ones, while the remainder are short and complete in themselves. No. 3 contains only two papers. The first is a "Third Memoir on a New Theory of Symmetric Functions," by Maj. P. A. MacMahon, R.A. This memoir by no means completes the exposition of the writer's theory, but both at the beginning and end he indicates his intention to resume the subject at some future period. The series was commenced by Capt. MacMahon, and continued by Maj. MacMahon; unless his prospects for speedy promotion are very bright, we hope he will not wait for Col. MacMahon to finish it. The other paper in No. 3 is in French, by M. Joseph Perott. It is curiously entitled "Remarque au sujet du théorème d'Euclide sur l'infinité du nombre des nombres premiers," which might lead the reader to expect a brief note calling attention to some point of interest in connection with Euclid's theorem. But the "remark" is one of the most elaborate and profound dissertations that have appeared in the *Journal*. M. Perott began it more than two years ago, in the *Journal* for January, 1889, where it occupied forty pages. He now gives us fifty-four pages more, to be continued, perhaps concluded, in a future number. Up to the present time M. Perott has made no reference to Euclid's theorem in the text of his "remark." Every year one, and sometimes three or four, new editions of the first six, and parts of the eleventh and twelfth, books of Euclid's 'Elements' are put upon the English market, but translations of the other books are very rare in private libraries and are frequently wanting in college libraries. As almost everything connected with the history of mathematics is completely ignored in most of our American colleges, a large majority of graduates are ignorant of the fact that the seventh, eighth, and ninth books of Euclid's 'Elements' do not relate to geometry at all, but are devoted exclusively to arithmetic. These books are seldom read, many professors of mathematics never having looked at them. In case this note should fall under the eye of some one desirous of reading M. Perott's paper and of seeing beforehand exactly what Euclid says in his theorem and its demonstration, we may save him some trouble by informing him that the theorem referred to in the title of M. Perott's "remark" is the twentieth proposition of the ninth book. He will find that Euclid does not say in so many words that the number of primes is infinite, but that however far the collection of primes is carried there are always more, which is equivalent to saying that the number is unlimited.

—The most significant novelties in the new Announcement of Courses of Instruction at Harvard for the next academic year—the so-called "Elective Pamphlet"—are found on its last pages in the addition of summer courses that may be counted for degrees and of courses for teachers. Both of these bear in an interesting way on the recent discussion about shortening the college course. The summer courses have been carried on for several years past, but have only this year been regularly listed as leading to the degree of A.B. or S.B. They include German, engineering, physics, botany, and geology. Geology and engineering gain from summer instruction, by reason of the opportunity then allowed for continuous work; physics and botany stand less in need of this aid, but still profit by it. The interruption of one course by another during the college term is here entirely avoided, as only one subject can be taken at a time. Courses in chemistry are also given in the summer, and have for some years been more largely attended than any other of the summer courses; but, for some reason not stated, they are not yet included among those that may be counted for the degrees. Five or six weeks is the minimum of attendance for these courses, and, if followed by a satisfactory examination, the work may count as an eighth of a college year's requirement, thus enabling the more energetic students to curtail their course by a small amount. When the summer courses are more largely elected, they will afford valuable means of comparing the results of continuous study with the discontinuous study of term-time. All the summer courses are open to others than members of the University.

—The courses for teachers constitute the most considerable departure from college traditions that we notice this year. They are doubtless the outcome of an effort made a year or more ago in Boston by some of the public-school teachers towards the establishment of a State Normal College, in which college graduates should find means of learning how to apply their knowledge to the art of teaching. Whether such a college is to be established or not, Harvard intends to offer what it can to the same end, and for this purpose has appointed a new professor, Dr. Paul Hanus, to deliver lectures on the history, theory, and art of teaching, and has at the same time arranged that eighteen of its regular professors shall give special courses on methods of elementary instruction in thirteen subjects, all of which are taught in the high schools. It is the intention to limit membership in these courses to graduates of colleges, and to others of experience and training, in order to supply the growing demand for teachers of better quality than can be found among the graduates of the normal schools, or among college graduates who have had no instruction in the methods of teaching. As this movement makes itself felt, one of the points most strongly emphasized in the recent report of the Harvard Overseers against the shortening of the college course will be gained, namely, an improvement in the teaching in the secondary schools and a better preparation for college work by those who come to college, including, perhaps, a shortening of the time given to the preparatory schools. With better preparation, with permission to count advanced studies at entrance, to use summer work towards the degree, and to take a certain number of additional courses every college year, it will be perfectly possible for good students to gain their degree in three years, and this without any degradation of the degree itself.

—The death, on the 2d of June, is announced of Mr. Hensleigh Wedgwood in London, at the ripe age of eighty-eight. Of half a-dozen books, or more, which he produced, the only one which has attracted any considerable attention is his fantastic 'Dictionary of English Etymology'; and this, strange to say, has reached a second edition. Its author can hard-

ly have been surpassed for the intrepid quixotism with which, mounted on his hobby, onomatopœia, he perseveringly tilted against all rational methods of accounting for the origin of speech. As, however, he was a man of learning, and explored far and wide in quest of facts that seemed to lend color to his chimera, he has served the interests of philology, monomaniac as he was, by accumulating a huge mass of materials which etymological investigators are thankful to be spared the trouble of searching out themselves.

BROWNING'S LIFE AND LETTERS.—II.

Life and Letters of Robert Browning. By Mrs. Sutherland Orr. 2 vols. Boston: Houghton, Mifflin & Co. 1891.

THE letters of Mrs. Browning are the principal source of what is told us about their life. She wrote much better letters than her husband, and he has taken pains to destroy as much of the personal records of his past as he could. She, therefore, becomes the central figure in these chapters — the real personality. She writes with great spirit, and describes both nature and human life very well. Many passages could be selected without fear of wearying the reader. The short bits of Italian scenery in the Apennines are admirable in feeling and poetical (in Mrs. Browning's taste) in diction; and the sense of physical enjoyment and of adventure she shows in her own share in the riding and climbing, after a fashion she never dreamed of, is very keenly felt. The episode of her meeting with George Sand, in Paris, is one that cannot be omitted. The great Frenchwoman was then invisible to every one, but Mrs. Browning wrote to her and she replied with an invitation to call. Mr. Browning himself was reluctant to undertake the affair: "I pricked Robert up to the leap—for he was really inclined to sit in his chair and be proud a little. 'No,' said I, 'you *shan't* be proud, and I *won't* be proud, and we *will* see her. I won't die, if I can help it, without seeing George Sand.'" So they went. "She received us very cordially with her hand held out, which I, in the emotion of the moment, stooped and kissed, upon which she exclaimed: 'Mais non! je ne veux pas,' and kissed me." Then follows an excellent description of her appearance and manner and the scene. They saw her more than once. This is the final impression:

"She has great nicety and refinement in her personal ways, I think, and the cigarette is really a feminine weapon if properly understood. Ah, but I didn't see her smoke. I was unfortunate. I could only go with Robert three times to her house, and once she was out. He was really very good and kind to let me go at all after he found out the sort of society rampant about her. He didn't like it extremely, but, being the best of husbands, he was lenient to my desires and yielded the point. She seems to live in the abomination of desolation, so far as regards society—crowds of ill-bred men who adore her, *à genoux bas*, betwixt a puff of smoke and an ejection of saliva—society of the ragged red diluted with the low theatrical. She herself so different, so apart, so alone, in her melancholy disdain. I was deeply interested in that poor woman; I felt a profound compassion for her. I didn't mind much even the Greek in Greek costume who *tutoyéd* her—and kissed her, I believe, so Robert said—or the other vulgar man of the theatre who went down on his knees and called her '*sublime*.' '*Caprice d'amitié*,' said she with her quiet, gentle scorn. A noble woman under the mud, be certain. *I* would kneel down to her, too, if she would leave it all, throw it off, and be herself as God made her. But she would not care for my kneeling; she does not care for me."

Another passage, which shows Mrs. Browning in surroundings in which she is seldom, if ever, thought of, is the description of the masked ball of the carnival:

"Very much amused I was. I like to see these characteristic things. (I shall never rest, Sarianna, till I risk my reputation at the *bal de l'Opéra* at Paris.) Do you think I was satisfied with staying in the box? No, indeed. Down I went, and Robert and I elbowed our way through the crowd to the remotest corner of the hall below. Somebody smote me on the shoulder and cried, '*Bella Mascherina!*' and I answered as impudently as one feels under a mask. At two o'clock in the morning, however, I had to give up and come away."

The mention of the journey which Carlyle took with them to Paris has one or two fine touches—his amusement with "Pen," their boy, whom they feared would annoy him, and Mrs. Browning's remark, "You come to understand perfectly, when you know him, that his bitterness is only melancholy, and his scorn, sensibility." On this visit Carlyle glanced at a figure of Christ crucified and said, in his "deliberate Scotch utterance: 'Ah, poor fellow, *your* part is played out.'"

Interesting as these letters are, they must be left without further quotation. They show comparatively little of the development of Browning's genius. He was much occupied with his wife, and he was also, it would seem, discouraged at the reception his works had met with. He formed a friendship with the Storys, at Rome, and began to draw and to model, and he is described as working hard and getting tired and talking of ideas that would come out in clay or marble. There was always a strong artistic taste in his temperament, and at this time it seems to have grown upon him at the expense of the poetical faculty. He did accomplish some poetry, writing by fits and starts when the mood came. He thought Mrs. Browning was the greater. "You are wrong, quite wrong," he wrote; "she has genius, I am only a painstaking fellow." The volume 'Men and Women' contains the principal work done during his married life. Mrs. Orr thinks that the Italian climate was beginning to have its weakening effect upon the poet, and something of his indisposition to write may have been due to that as well as to his unsettled life, with its duties, his wandering into other fields of art, and the lack of recognition. His marriage, however, had brought happiness, and the death of his wife was a severer blow than her invalid condition would seem to have justified. She died somewhat suddenly, and it is doubtful whether she knew the end was near. A letter from Browning is printed which describes in detail her last hours. This biography has the sanction of the poet's family, and therefore all that we shall say is, that if Browning, by diligently collecting and burning all his correspondence so far as he could, was yet unable to prevent the public from gazing upon the most sacred and tender scene in all his life, the effort to destroy such records may as well be abandoned. And, indeed, the reflection is obvious, after reading these volumes, that Browning's destruction of his papers has merely mutilated the work by making it barren of his personality in those parts where no record survives; in the rest, he remains, as every man must, at the mercy of his heirs and correspondents. In every such case, there will always be a large part of the papers of which possession cannot be obtained.

After the death of his wife, Browning's life presents nothing externally striking. He returned to England and became again a member of society. His vacations were spent in out-of-the-way places on the French Coast or in the mountains of northern Italy, and latterly at Venice. He produced the "murder-story," as he styles 'The Ring and the Book,' and then in succession the less successful of his works. His fame was now established, and the honors that were accorded to it, more especially the University honors, were pleasing to him. It is plain, too, that he was more flattered by the founding of the Browning Society than he could modestly acknowledge. In what he says of his literary reputation only one thing is particularly noticeable—his complaint that his friends had not spoken for him when their words would have had weight. He felt that it was not to critics and brother authors that he owed his public success. He was much irritated when he learned of the letter which Dickens wrote to Forster in praise of 'A Blot on the 'Scutcheon' and directed to have shown to him, but which he first saw in Forster's 'Life of Dickens' thirty years later. He writes comparing his present life in London with that of the earlier period:

"I used to go out then and see far more of merely literary people, writers, etc., than I do now—but what came of it? There were always a few people who had a certain opinion of my poems, but nobody cared to speak what he thought, or the things printed twenty-five years ago would not have waited so long for a good word; but at last a new set of men arrive who don't mind the conventionalities of ignoring one and seeing everything in another. Chapman says the new orders come from Oxford and Cambridge, and all my new cultivators are young men; more than that, I observe that some of my old friends don't like at all the irruption of outsiders who rescue me from their sober and private approval, and take those words out of their mouths 'which they always meant to say' and never did."

He was much devoted to Carlyle, and defended him after his death, but could not understand why he had not given in public the praise he gave privately, and he commented with just a touch of bitterness on some "extravagant eulogium" which in earlier days he had received from him tête-à-tête—"If only these words had ever been repeated in public, what good they might have done me!" Evidently he felt he had not only been neglected by the public, but also badly treated by those literary men who professed to value his work. In this way there was bred in him a certain indifference to the public which led to his allowing his naturally great eccentricity of mind full play. In his later works he practically ignored the public, and he furnishes a curious instance of a poet's misjudgment of his productions. "His constant conviction was," says Mrs. Orr, "that the latest must be the best, because the outcome of the fullest mental experience and of the longest practice in his art." This proves that he had no power of self-criticism. He wrote at a heat often, and this seems to have been always his habit in regard to shorter poems. At one time he determined to write a poem every day, and "Childe Roland" and "Women and Roses" were among those thus turned off. But he is also said to have corrected assiduously. In later life twenty or thirty lines in a morning was thought good work, and presumably this was a first draft to be afterwards revised. It does not appear that he had command of style, except so far as it sprang from strong feeling or a dramatic rather than a literary instinct; if he had possessed it, his "assiduous correction" would have been more effective. Another indication of this trait is that he denied that "even the first of Greek writers" were "models of literary style"; and Mrs. Orr adds this curious and enlightening remark: "The pretensions raised for them on this ground were inconceivable to him, and his translation

of the 'Agamemnon,' published 1877, was partly made, I am convinced, for the pleasure of exposing these claims and of rebuking them." It has hitherto been thought that a certain affinity drew him to the Greek poet of most rugged style, but it seems he used his own talent for word-sculpture to "rebuke" those who enjoyed its grand form in Æschylus.

Another misconception which Mrs. Orr corrects is that which assumes much recondite learning in Browning because he wears the appearance of it; he had no taste for ancient chroniclers, or for such reading as his father delighted in, but he came on his dramatic subjects by accident, and undertook research only for the purpose of verification, except possibly in the case of 'Sordello.' Altogether his scholarship, except in Greek and Spanish literature, seems to have been much overestimated. Mrs. Orr indulges in a good deal of criticism, often of a careful kind, and indeed so severe at times as to verge on the scientific; but to examine it would require a separate article. She brings out the full meaning of 'La Saisiaz' as "conclusive both in form and matter as to his heterodox attitude towards Christianity"; it is a plea for the value to the soul of religious incertitude. He was, she says, "a Christian, in his way," as much at the time of this poem as ever since boyhood, but his argument leaves "no place for the idea, however indefinite, of a Christian revelation" on the subject of immortality: "Christ remained for Mr. Browning a mystery and a message of divine love, but no messenger of divine intention toward mankind." The remarks on "Christmas Eve" and "Easter-day" point the same moral; and Mrs. Orr sums up the matter finally by saying that "the Evangelical Christian and the subjective idealist philosopher were curiously blended in his composition." The whole criticism of Browning's religious ideas and impressions, though just from the point of view of a thinker, is coldly unsympathetic, and tends to bring out with a painful distinctness the very imperfect thinking of the poet. The point is a delicate one, but it is not so much so as the other question arising in the criticism of that "perverse" and "cynical" poem, "Fifine at the Fair," and those allied to it in theme. Mrs. Orr's defence is, that this plea for self-indulgence is merely dramatic, though she censures the poet for not making his condemnation plain; but though this were to be allowed, her defence of the related poem, "The Statue and the Bust," rests on a distinction of a jesuitical sort. The only remaining suggestion of great interest in her general criticism is that *Pompilia* derives her vitality as a woman from Mrs. Browning, from whom some of her qualities appear to have been studied.

Browning's personality is described by the biographer, not set forth in his own words and acts. In drawing the portrait towards the close of the work, she reverts to the heredity question of the first chapter. She thinks he derived from his mother, a delicate woman, that nervous excitability which was his dominant physical quality. His pulse was "slow and not strong," and he was obliged to make an effort in order to join in society. His "gayety" was not entirely natural and unforced. His "effusiveness" in "greeting alike old friends and new" is ascribed to "a momentary lack of self-possession," and his excited habit of dinner-table talk is said to have grown upon him as a result of the physical and moral effort he made from the first to be entertaining. His "loud voice," though perhaps somewhat due to the deafness of several of his early friends, bore the same "traces of unconscious nervous stimulation"; but though "natural to him in anger or excitement," this loudness was not always used. Mrs. Orr repeats his saying, "I am nervous to such a degree that I might fancy I could not enter a drawing-room, if I did not know from long experience that I can do it." Of course he could not make an impromptu speech. He was irritable by nature, and "even serious and private conversation on any subject on which he was not neutral" had its difficulties; "feeling, imagination, and the vividness of personal points of view constantly thwarted the attempt at a dispassionate exchange of ideas." He had his mind made up on most topics of the day, one of them being woman's suffrage, in favor of which he once contemplated writing a drama. In the last year of his life he changed his mind on the question, not on any rational ground.

Women attracted him far more than men. They were his confidants; he preferred their society, and he appealed to them by an "often caressing kindness of manner." He does not appear to have understood, in Mrs. Orr's judgment, the conventionalities and differences inherent in sex, but applied to women the same standard as to men, or, when he was "confronted with some divergence," he was perplexed and would say that it was "impossible to judge how a woman would act in such or such a case," when in fact "it would be inconceivable to a normal woman, and therefore to the generality of men, that she should act in any but one way." Mrs. Orr notices that none of the women of his poems are conventional. The firmest of his male friends appear to have been foreigners, but we see very little of such connections. His affections were more active as he grew older. "The parental instinct," says Mrs. Orr, "was among the weakest in his nature," but his devotion to his son was great. Other children he seems not to have cared for. "He was capable," she says again, "of the largest self-sacrifice and of the smallest self-denial," but with this she states that he was defective in broad sympathy. He made a virtue of happiness and cultivated it "directly and increasingly"; and "because of certain sufferings that had been connected with them he would often have refused to live his happiest days again." He was intolerant and hard in opposition, especially if he had a strong personal conviction and was interested in the subject. His strength was "passive" rather than "active," his disposition acquiescent and therefore optimistic. His admiration for men of genius was very great, and sincere towards his contemporaries; his love of fame and interest in his own success were the self-regarding side of this strong feeling.

Such traits as these which have been briefly mentioned are the leading lines of Mrs. Orr's portrait, and she shows an intimate knowledge and close observation of her friend. The whole is in keeping, and the intention of the author to tell the truth with considerable frankness is very plain. She has not made a hero of her subject—the *nimbus* is conspicuously absent. There may be disappointment that there is not more self-revelation of Browning; but he evidently expressed himself only in his works. His letters are uninteresting, and show, like the essay on Shelley, that he was an exception to the rule that poets write good prose. The loss of his papers is, therefore, probably immaterial.

RECENT PHILOSOPHICAL WORKS.

Hegel's Logic: A Book on the Genesis of the Categories of the Mind. A Critical Exposition. By William T. Harris. Chicago: S. C. Griggs & Co. 1890. 12mo, Pp. 403.

The Philosophy of Right. With Special Reference to the Principles and Development of Law. By Diodato Lioy, Professor in the University of Naples. Translated from the Italian by W. Hastie, M.A., B.D. London: Kegan Paul, Trench, Trübner & Co. 1891. Two vols. 8vo. Pp. 353 and 392.

The Philosophical Works of Leibnitz (Selections). Translated from the original Latin and French, with notes, by George Martin Duncan, Instructor in Mental and Moral Philosophy, Yale University. New Haven: Tuttle, Moorehouse & Taylor. 1890. 8vo, pp. 392.

Outlines of a Critical Theory of Ethics. By John Dewey, Professor of Philosophy in the University of Michigan. Ann Arbor, Michigan: The Inland Press. 1891. 12mo, pp. 253.

The Soul of Man: An Investigation of the Facts of Physiological and Experimental Psychology. By Dr. Paul Carus. Chicago: The *Open Court* Publishing Company. 1891. 12mo, pp. 458.

Some years ago Dr. McCosh told us, in his positive way, that Hegelianism had emigrated from its fatherland and had settled on the banks of the Mississippi. Prof. Harris and his little coterie were its prophets. St. Louis, however, is no longer its Mecca, for the chief of the elect has become United States Commissioner of Education at Washington, D. C., though he still interprets the Sibylline oracles of his master. Prof. Harris tells us in the preface that Hegel's Logic has been "a sort of centre in all his thinking since the year 1860," and that, when asked in 1883 to write this volume, he thought he could not "prepare a worthy book for twenty years." As a matter of fact, no one since Hegel tried it has been able to satisfy anybody about his system; and judging from the kind of success usually attained with Hegel, the secret when it is found cannot be transmitted or communicated. Prof. Harris's book has all the faults and none of the merits of Hegel. We question whether any other man in America knows what he means by any of the phrases on which the expression of his doctrine depends—"vanishing of the category of the vanishing," "passing into its opposites," "the negative of negatives is reality," "the becoming of individuality," "the identity of duality and particularity," and so on with fully two-thirds of the volume, in all sorts of permutations and combinations. If the admirers of Mr. Herbert Spencer understand what is meant by the "passage of the homogeneous into the heterogeneous," they can probably understand the foregoing. The professed interpreters of Hegel would do well in the future if they expressed themselves in plain English, as Mr. Spencer has done.

The 'Philosophy of Right' is rather a new book of its kind for English readers; but it is a very useful one. Paul Janet has two able volumes in French on the history of politics in relation to ethics, and some of us are hoping that Prof. Sidgwick will give us the results of his studies in the same direction; but until then we must be content with what other nations, and especially Italy, have done upon the relation between ethics and law or politics. Prof. Lioy's volumes are both too full and too brief. The summary of the history of philosophy might have been omitted, as it has not been written with a direct reference to the main subject. On the other hand, such topics as Commerce and the Family are treated much too briefly. Nevertheless, the discussion is philosophical and very comprehensive. The author's division of his subject, after his general survey in the "Prolegomena," is a peculiar

one. He divides it into the "Objects of Right," which are religion, science, art, industry, commerce, morality, and justice, and the "Subjects of Right," which are the individual, family, classes, community, province, state, and international states. The chief fault of the work is that it is given too much to the statement of mere historical opinions on the matter, and the reader is left to take mere abstracts of men's views on authority, or suspend his judgment until he consults a thousand volumes to verify them. It would have been better to treat the subject more directly. The translator's preface is an admirable introduction, and his version is smooth and excellent English. The index, although new in its style for English, is a very good one.

The volume on Leibnitz has no external attractions whatever. The paper and type are very poor and the binding is of the worst. The translator might have made a wiser choice of material from Leibnitz, devoid of a theological tendency, and greatly improved his too perfunctory notes. A good and complete translation of that philosopher, with a careful estimation of his doctrine, in some such manner as T. H. Green has dealt with Hume, or Prof. Fraser with Berkeley, would be a very desirable work. As far as it goes, with some exceptions, Mr. Duncan's rendering is to be praised.

Prof. Dewey has disappointed us. We expected a volume at least equal to his 'Psychology' and his monograph on Leibnitz; but his 'Ethics' falls below the level of either. Prof. Dewey claims to have made here "an independent contribution to ethical science," but the evidence that the volume is merely classroom notes and dictations is so great that no one would suspect such an achievement on the author's part. Prof. Dewey evidently expects the book to be serviceable as a text-book, but we see in it few qualifications for that purpose. It is, to be sure, an improvement in method upon the old dogmatic systems of outlines and definitions; it is confined strictly to the theoretical issues of the day; but it is deficient in the essential features of a teacher's text. It is not systematic or complete, and contains too much historical discussion for so small a work to be adapted to such an object.

The volume by Dr. Carus is remarkable only for 152 illustrations and diagrams; not exactly of the soul, but of everything except that. Such an amount of ill-digested material is seldom put in book form for the philosophic public.

In Scripture Lands: New Views of Sacred Places. By Edward L. Wilson. With 150 illustrations from original photographs by the author. Charles Scribner's Sons. 1890.

THIS is an account of a difficult, dangerous, and expensive trip made by a professional photographer from Egypt through Sinai to the head of the gulf of 'Akabah; thence up the 'Arabah to Petra, which, by an ingenious stratagem, he contrived to enter unobserved; thence through a part of the wilderness of et-Tih in search of Kadesh Barnea, and through the Negeb to Hebron; after which he seems to have travelled on beaten tracks through the Holy Land and to Damascus. The book is a further development of some illustrated magazine articles which appeared shortly after Mr. Wilson's return, and the chapter on Petra still bears the fingermarks of its independent origin. As might be expected, the main interest and value of the work lie in the illustrations, but the narrative of travel also, at least in the first part of the book, until the Palestinian border is reached, is interesting, and even exciting, and the descriptions are often picturesque.

The opening chapter narrates the finding of the mummy of Rameses II., and nearly forty other mummies "of kings, queens, princes, and priests," in the summer of 1881, and an account of the author's own visit to the site of the famous "find" in company with Emil Brugsch Bey and Prof. Maspero, a few months after the discovery. The text is accompanied by some excellent and very welcome illustrations. The two chapters which follow, devoted to Mt. Sinai and the trip up the 'Arabah, including the account of the artifice by which the author stole into Petra, are thoroughly readable and interesting, and, while they fail to tell much which might have been told, they nevertheless contribute, both by descriptions and illustrations, to a better knowledge of the region traversed. The fourth chapter, that on Petra, is by far the most important in the whole volume. For four days Mr. Wilson contrived, by dint of diplomacy, pluck, and much backsheesh, to remain in Petra, thus securing a valuable photographic record of the remarkable rock sculptures of the Nabathæan capital. His photographs of Petra, illustrations from about twenty of the best of which are given in this volume, constitute a real contribution to archæology. (It is to be regretted that they could not all be published on a larger scale.) This chapter is fascinating. It is not written from the standpoint of the archæologist, and the map (Strong and Ward's survey) is unsatisfactory and on too small a scale; but the illustrations are beautiful, the author fully appreciated the romantic and weird picturesqueness of the ruins and their surroundings, and the incidents of his sojourn were decidedly exciting.

Leaving Petra, Mr. Wilson, as already stated, struck westward into the wilderness of et-Tih in search of the oasis of Qadees, identified by Rowlands and Trumbull as Kadesh Barnea, and visited by the latter only the year before Mr. Wilson's trip. He failed to reach it, but reports the discovery of another large oasis "several miles north of 'Ain Qadees," which he believes to have been previously unvisited. His description sounds very much like Trumbull's description of 'Ain-el-Qadayrât, to the northwest of 'Ain-Qadees.

The remaining nine chapters of Mr. Wilson's book deal with lands often travelled and frequently described, and, with one exception, contain nothing worthy of particular notice. The narrative is rambling and the historical and other allusions inaccurate and unscientific. The only excuse for this portion of the work is the very pretty illustrations.

The exception referred to is chap. ix., a discussion from the pen of Dr. Chas. S. Robinson on the site of Calvary, advocating the claims of the hill, just outside of the Damascus gate, in which is the cave now known as Jeremiah's Grotto. The argument turns on the form of the hill, which is supposed to resemble a skull, a resemblance further fortified by "two cavities or holes in the rock; these served as eyeless sockets." Mr. Wilson's photographs, which accompany the article, do not exhibit this resemblance to a skull, which Dr. Robinson seems to have been able to observe only from a certain point on the Mount of Olives; neither, studying the question on the spot, did the present writer see any strongly marked likeness to a skull. Furthermore, supposing such a resemblance to exist at the present time, did it exist at the commencement of the Christian era? Everything around Jerusalem has been so modified and transformed by the accumulations and excavations of the ages that, as in Rome, no reliance can be placed on the argument from external form except in the case of a few main features. Without applying the magnifying glass or the spade, you cannot be sure of recognizing the ancient landmarks of Jerusalem from their present appearance. This argument from form must therefore be pronounced weak. A passage is quoted, however (p. 233), from Laurence Oliphant's 'Haifa,' in which the latter claims that the Mishnah and current tradition satisfactorily identify Jeremiah's Grotto, or rather the hill above it, with "the House of Stoning," or place of public execution mentioned in the Talmud about A.D. 150. Here is a suggestion of a strong argument, but even here proofs fail, and up to the present time, while the arguments against the traditional site of Calvary, within the limits of the Church of the Holy Sepulchre, are, if not absolutely convincing, nevertheless strong enough to create a decided presumption against that site, nothing like proof of the claims of any other site has been presented. The discussion has raised questions which can probably be settled finally only by scientific, continuous, and systematic excavations in and about Jerusalem, which are not allowed by the Turkish Government. In the meantime we must be content to confess that our actual knowledge of the topography of ancient Jerusalem is meagre and uncertain in the extreme.

The Compounding of English Words: When and Why Joining or Separation is Preferable; with concise rules and alphabetical lists. By F. Horace Teall. New York: John Ireland. 1891. Pp. 223.

THIS treatise is a chapter in the English usage of the hyphen, a protest against the excessive employment of that point, and an endeavor to lay down rules for compounding that will secure the greatest possible consistency. It is, the author believes, and we have no doubt, the first work of its kind, and one much needed. Mr. Teall, who comes of a family of proof-readers, knows by experience the difficulty of securing uniformity of punctuation, and was well qualified to expose the inconsistent practice of the natural authority in the matter of compounds, the Dictionary. He interests the reader at once by a destructive attack, in this particular, on Webster, the Imperial, Worcester, and even Dr. Murray's 'New English Dictionary,' whose editors he easily and abundantly convicts of negligence or want of fixed principles. The rules of the grammarians are in turn examined and confuted, but less effectively and clearly, because they are not taken up by themselves in close sequence with the exposure of their fellow-sinners. Mr. Teall, in fact, having got through—at least for the moment—with the lexicographers, begins his general discussion in his third chapter, and incidentally castigates the grammarians all the way along to the eighth chapter, which specifically deals with "Bad Teaching by Noted Teachers." In chapter seven he gives a useful annotated list of phrases needlessly compounded; in chapter eleven, an even more useful list of inseparable compounds.

These two lists will, we believe, float the work, for Mr. Teall has not the gift of clear expression and definition, and his arrangement is very defective. The several classes whom he aims to serve—"authors, printers, teachers, telegraphers, stenographers, typewriters, and all who care for the correct writing of English"—would have been content with a mere dictionary of compound words, which Mr. Teall pronounces "impracticable,

for obvious reasons." These reasons are not apparent to us. What is wanted is a fairly comprehensive, authoritative list for ready reference; and if it contained indications of the compiler's departure from usage, with brief justifications, he would have left nothing to be desired and would have measurably shaped usage, which is, after all, only the consensus of the best printing-offices. For our own part we should have little difficulty in deferring to Mr. Teall's judgment as to most compounds, while we cannot think highly of his exposition, and are sure that his rules are so numerous and so obscure that nobody will try to master them.

Take the compound *type-writer* as an example. Mr. Teall hyphens it in his dedication, but as he gives no list of hyphened compounds, and omits the word from his inseparables, how is the user of his book to discover (1) that the two parts should be joined at all, or (2) that they should be joined by a hyphen instead of being run together?

Mr. Teall's rules are first formally set forth on p. 137, but on p. 59 we read:

"Compounding [of two nouns] should take place only when the first of two primitively naming words remains a noun; in other words, only when no real change or distinction of aspect is attributed to the second by the first."

On p. 127:

"Each word should always remain separate when used exactly in a normal relation, even when it and another word together have a joint unity of sense; and . . . each pair of words not in normal relation to each other should be joined, to give one form which preserves the proper construction instead of two which violate it."

In the chapter "When Two Words Become One," are laid down six rules, upon close study of which the inquirer may conclude that the first fits the case of *type-writer*, viz.:

"Two nouns used together merely as nouns, unless in apposition, become properly in such use one compound noun. That is, two nouns should be compounded if they are simply put together arbitrarily to name one thing, with no actual descriptive idea except that conveyed by the name in its entirety; but if the distinguishing descriptive idea is entirely inherent in the first word, it should be considered an adjective, and so stand apart."

There are fourteen models under this rule, of which only the fifth is in any way applicable:

"The name of an implement or agent of action coupled with that of the object acted upon or with, as *hair-brush* (a brush for the hair), *paint-brush*, . . . *telegraph-pole*, . . ."

Finally, to determine whether a hyphen should be used or the joining be close, we must choose between three badly punctuated rules remarkable for want of lucidity:

"I.—Two words used jointly in the office of one word, with no actual elementary significance other than by mere allusion of the kind expressed in the joint term, should be made a solid word.

"II.—A pair of words which are when used in literal meaning a hyphened compound or two separate words should be made an inseparable compound when used with a purely arbitrary meaning.

"III.—The solid one-word form should be given to every joint use of a literal word and an element which has ceased to be or never has been used as a separate English word; also to every joining of a word in its literal sense with a following word which has in this particular use a merely general sense."

From all this apparatus Mr. Teall deduces for his own usage a hyphened compound, *type-writer;* but we cannot imagine his reason for disregarding its analogy at all points with *handwriting*, which he places among the inseparables.

We have no space for further details or criticism. The matter of compounding is capable of very brief summarizing. It can never be precisely fixed or uniform. It is employed mainly to prevent ambiguity, but partly to please the eye. Coalescence is a matter of usage, and is limited by the genius of the language, which abhors very long words or an odd aggregation of consonants, or any combination which makes it difficult to recognize the parts of the compound at a glance and to pronounce correctly; the mute *e* being here a frequent stumbling-block. Mr. Teall properly lays stress on analogy if we are to have a system, but he tries to apply throughout a grammatical criterion which leads him into endless mazes of definition and subdivision. He calls Webster's *nightwatch* "an instance of coalescence absolutely without defence," whereas it needs no more defence than his *nightgown*, *night-flower*, or even *nightmare*. His book, as we have said, will accomplish its aim as far as its lists are availed of; and it will also cause the dictionary-makers (to whom the problem is a very practical one) serious reflection. Beyond this it will not go, but we thank him for his endeavor.

BOOKS OF THE WEEK.

Abbott, E. A. Philomythus. 2d ed. Macmillan & Co. $1.25.
Alarcon. Moors and Christians. Cassell Publishing Co. 50 cents.
Austin, A. Lyrical Poems. Macmillan & Co. $1.75.
Baumeister, R. The Cleaning and Sewerage of Cities. Engineering News Publishing Co.
Boyesen, H. H. The Mammon of Unrighteousness. John W. Lovell Co. $1.25.
Bazán, Emilia P. A Wedding Trip. Cassell Publishing Co. $1.
Capp, W. M. The Daughter. Philadelphia: F. A. Davis. $1.

JERRY.

By Sarah Barnwell Elliott. 12mo, $1.25.

Literary World: "One of the strongest among recent works of fiction. The story is maintained at an intense pitch, and is virile in its force. . . . Miss Elliott's striking story."

HENRY HOLT & CO., New York

A NEW SUMMER NOVEL.

JUST PUBLISHED:

A Work of Whimsical Drollery, entitled

THE BACHELOR'S CLUB.

By I. Zangwill.

1 vol., 12mo, illustrated with over thirty spirited drawings by George Hutchinson.

In 'The Bachelor's Club' the author has struck a fresh vein of bizarre humor, and embodied in it a good deal of topical satire as well as quaintly expressed wisdom and epigrammatic knowledge of the world.

For sale by all booksellers, or sent by mail, postage paid, on receipt of the price by the publishers,

BRENTANO'S, 5 Union Square, New York City.

COLUMBIA.

A Story of the Discovery of America. By John R. Musick. 12mo, Half Rox., $1.25; paper, 75c.

A thrilling historical novel, relating the adventures and trials of Christopher Columbus, his discovery of the New World. A wholesome love story is also interwoven. Illustrated with photogravures.

This is the first of a series of historical novels that are soon to prove of great interest to American readers.

Worthington Co., 747 B'way, N. Y.

Letters of Credit. We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and the West Indies; also make Collections and issue Commercial and Travellers' Credits, available in all parts of the world.

Brown Brothers & Co., Bankers,
NO. 59 WALL STREET, NEW YORK.

Coast of Maine.

CAPE ROSIER.

The lands of the "Cape Rosier Associates" on Penobscot Bay, 50 miles nearer Boston and the West than Bar Harbor, Mt. Desert, are offered for sale in parcels of five and ten acres and upwards. These lands comprise over ten miles of almost continuous shore-frontage in one of the boldest and most beautiful sections on the coast, twelve hours' journey from Boston. They front upon fine harbors, have beautiful rocky shores, beaches, woods, and mountain views. The drives along the shores and among the hills are very varied and beautiful. New wharves have been built, and new connections with daily trains and steamboats established. In these lands is offered an exceptional opportunity to purchase for very small sums fine and perfectly protected seashore estates. The lands will not be sold for speculation or in small lots.

20 East 16th St., New York.
Branch during summer season, Store No. 1, Grand Union Hotel, Saratoga Springs.

Exhaustion.

HORSFORD'S ACID PHOSPHATE.

The phosphates of the system are consumed with every effort, and exhaustion usually indicates a lack of supply. The Acid Phosphate supplies the phosphates, thereby relieving exhaustion and increasing the capacity for labor. Pleasant to the taste.

Dr. A. N. Krout, Van Wert, O., says: "Decidedly beneficial in nervous exhaustion."

Dr. S. T. Newman, St. Louis, Mo, says:

"A remedy of great service in many forms of exhaustion."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION: Be sure the word "Horsford's" is printed on the label. All others are spurious. Never sold in bulk.

Back Numbers of "The Nation."

In response to frequent inquiries from subscribers:

An incomplete set of THE NATION has little or no market value. Partial sets, bound and unbound, are always obtainable (usually lacking the earliest volumes), and do not command high rates. The bindings generally count for nothing, owing to great diversity of styles. Volume I. has readily brought $10 and upward when complete, bound or unbound, but will bring very little in proportion if a single number is missing. Volumes II. and III. are also scarce, but not so high-priced as the first

Complete sets, both bound and unbound, have sold for $100, with tolerably quick bidders, and have an increasing value year by year.

Single numbers not more than a year old can usually be supplied by the publishers at 10 cents each. For numbers more than a year old purchasers are referred to Mr. J. W. Christopher, 47 Dey St., New York; Mr. A. S. Clark, 34 Park Row, or H. Williams, 195 West Tenth Street.

The publishers no longer undertake to buy or sell numbers or volumes more than a year old, and can only recommend sellers or purchasers to negotiate with a dealer, or to advertise in THE NATION.

[Publication was begun July 1, 1865, Vol. I. comprising the last half-year. Two volumes per year have since been issued, Vol. LI. comprising the last half-year of 1890.]

Reading Case for the Nation,

To receive the current numbers in a convenient (temporary) form. Substantially made, bound in cloth, with *The Nation* stamped on the side in gold. Holds about one volume. Papers easily and neatly adjusted. Sent, post-paid, on receipt of 75 cents.

SUMMER READING.

Tauchnitz Edition. 2,600 volumes of the best English Fiction, at 50 cents a volume. Good paper and print, in bound form. A valuable addition to every library. From 85 cents to $1.30, bound.

French Books, clean and interesting for young and old alike: Nouvelle Collection, Charpentier, 75 cents a volume, by Fabre, Chalmette, Theuriet, and others. Many other French Novels on hand.

German Fiction, Scheffel, Marlitt, Heimburg, Werner, Spielhagen, and others. Lists on application,

The Modalist; OR, THE LAWS OF RATIONAL CONVICTION. A Text-Book in Formal or General Logic. By EDWARD JOHN HAMILTON, D.D., Albert Barnes Professor of Intellectual Philosophy, Hamilton College, N. Y. 8vo, cloth, vi+331 pages. Price by mail, postpaid, $1.40.

As the work of a strong and original thinker, this book is specially commended to the attention of all interested in the subject.

GINN & COMPANY, Publishers,
BOSTON, NEW YORK, AND CHICAGO.

SILVER, BURDETT & CO.,
PUBLISHERS,
6 HANCOCK AVENUE, BOSTON,

announce with satisfaction a new series of school readers—*The Normal Course in Reading* (Todd-Powell), unique in design, attractive in style, pedagogical in matter and arrangement.

Catalogue giving full information sent, postpaid, on application.

Comparative View of the Executive and Legislative Departments of the Governments of the United States, France, England, and Germany.

By JOHN WENZEL, Librarian of Boston University. Flexible cloth, 26 pages. Retail price, 20 cents.

An outline of the four great Constitutional Governments, arranged in parallel columns, so that similar topics are grouped together. It should find a wide and hearty acceptance among teachers and students.
D. C. HEATH & CO., Boston, New York, and Chicago.

A TREATISE ON MASSAGE.

By DOUGLAS GRAHAM, M.D.
New Edition. Octavo, 342 pages.
Mailed to any part of the world for $2.75 by
DAMRELL & UPHAM, Boston, Mass.

"This treatise is of the highest intrinsic value. Full of valuable and precise information, it never becomes dry or uninteresting. American humor sparkles in almost every page. A vein of strong common-sense runs throughout. The arrangement is excellent."—*The London Practitioner, March*, 1891.

EUROPEAN SUMMER AND WINTER Resort, University town of Innsbruck, Tirol, Austria; 1,900 feet above the sea, with dry, bracing climate. Hotel Tirol, open all the year, Carl Landsee, Proprietor. Large, airy, sunny rooms, well furnished. Elevator. Superior cuisine (table d'hôte or à la carte). Reduced rates in winter. Carriages and sleighs at low rates. Charming excursions made from the hotel at all seasons. Unusual advantages for securing teachers of the languages, history, science, art, music, etc., at very moderate terms. Eminent medical care and skilled nurses if desired. Best English and American references. Illustrated pamphlets sent on application.

A. S. CLARK, BOOKSELLER AND Newsdealer, 34 Park Row, New York City. Catalogue No. 32 ready.

MATTHEW ARNOLD IN THE "NINETEENTH CENTURY."

"The New York NATION—a newspaper which I read regularly and with profit, a newspaper which is the best, so far as my experience goes, of all American newspapers, and one of the best newspapers anywhere."

THE NATION,

an independent weekly journal, was established in 1865. Its contributors include the most prominent names in literature, science, and art both in this country and abroad. It is emphatically found in the homes of people of culture and refinement. No intelligent American desirous of keeping abreast of the best political and literary thought of the day can afford to be without it. Subscription price, $3.00 a year, postpaid.

RECENT FICTION.

THE THREE MISS KINGS.

By ADA CAMBRIDGE, author of [illegible]ardian.' No. 75, Town and Country Library. 12mo. Paper, [illegible]; cloth, 75 cents.

A novel by one of the brightest of the Aust[illegible]iters who are now claiming public attention. A gracefully written story of [illegible] life, which is certain to hold the reader's interest.

CONSEQUENCES.

By EGERTON CASTLE. No. 74, Town and Country Library. 12mo. Paper, 50 cents; cloth, $1.00.

"It is a real pleasure to welcome a new novelist who shows both promise and performance. . . . The work is distinguished by *verve*, by close and wide observation of the ways and cities of many men, by touches of a reflection which is neither shallow nor charged with the trappings and suits of weightiness; and in many ways, not least in the striking end, it is decidedly original."—*Saturday Review.*

FROM SHADOW TO SUNLIGHT.

By the MARQUIS OF LORNE, author of 'Love and Peril,' 'A Story of the Far Northwest,' etc. The second story in Appletons' Summer Series. 16mo. Half cloth, with specially designed cover, 50 cents.

TOURMALIN'S TIME CHEQUES.

By F. ANSTEY, author of 'Vice Versa,' 'The Giant's Robe,' etc. Appletons' Summer Series. 16mo. Half cloth, 50 cents.

"Each cheque is good for several laughs to any one with any sense of humor. The book is as full of the unexpected as any of its predecessors from the same pen, and contains as many 'situations' as a good comedy."—*New York Herald.*
